

### GENERAL DESCRIPTION

The ICS9DB306 is a high performance 1-to-6 Differential-to-LVPECL Jitter Attenuator designed for use in PCI Express™ systems. In some PCI Express systems, such as those found in desktop PCs, the PCI Express clocks are generated from a low bandwidth, high phase noise PLL frequency synthesizer. In these systems, a zero delay buffer may be required to attenuate high frequency random and deterministic jitter components from the PLL synthesizer and from the system board. The ICS9DB306 has 2 PLL bandwidth modes. In low bandwidth mode, the PLL loop BW is about 500kHz and this setting will attenuate much of the jitter from the reference clock input while being high enough to pass a triangular input spread spectrum profile. There is also a high bandwidth mode which sets the PLL bandwidth at 1MHz which will pass more spread spectrum modulation.

For serdes which have x30 reference multipliers instead of x25 multipliers, 5 of the 6 PCI Express outputs (PCIEX1:5) can be set for 125MHz instead of 100MHz by configuring the appropriate frequency select pins (FS0:1). Output PCIEX0 will always run at the reference clock frequency (usually 100MHz) in desktop PC PCI Express Applications.

### BLOCK DIAGRAM

### FEATURES

- Six differential LVPECL output pairs
- One differential clock input
- CLK and nCLK supports the following input types: LVPECL, LVDS, LVHSTL, SSTL, HCSL
- Maximum output frequency: 140MHz
- Input frequency range: 90MHz - 140MHz
- VCO range: 450MHz - 700MHz
- Output skew: 135ps (maximum)
- Cycle-to-Cycle jitter: 30ps (maximum)
- RMS phase jitter @ 100MHz, (1.5MHz - 22MHz): 3ps (typical)
- 3.3V operating supply
- 0°C to 70°C ambient operating temperature
- Available in both standard (RoHS 5) and lead-free (RoHS 6) packages
- Industrial temperature information available upon request

TABLE 1. PIN DESCRIPTIONS

Number	Name	Type		Description
1, 14, 20	V <sub>EE</sub>	Power		Negative supply pins.
2, 3	PCIEXT1, PCIEXC1	Output		Differential output pairs. LVPECL interface levels.
4, 5	PCIEXT2, PCIEXC2	Output		Differential output pairs. LVPECL interface levels.
6, 9, 15, 28	V <sub>CC</sub>	Power		Core supply pins.
7, 8	nOE0, nOE1	Input	Pulldown	Output enable. When HIGH, forces true outputs (PCIEXTx) to go LOW and the inverted outputs (PCIEXCx) to go HIGH. When LOW, outputs are enabled. LVCMOS/LVTTL interface levels.
10, 11	PCIEXC3, PCIEXT3	Output		Differential output pairs. LVPECL interface levels.
12, 13	PCIEXC4, PCIEXT4	Output		Differential output pairs. LVPECL interface levels.
16, 17	PCIEXC5, PCIEXT5	Output		Differential output pairs. LVPECL interface levels.
18	FS1		Pulldown	Frequency select pin. LVCMOS/LVTTL interface levels.
19	BYPASS	Input	Pulldown	Bypass select pin. When HIGH, the PLL is in bypass mode, and the device can function as a 1:6 buffer. LVCMOS/LVTTL interface levels.
21	V <sub>CCA</sub>	Power		Analog supply pin. Requires 24Ω series resistor.
22	PLL_BW	Input	Pullup	Selects PLL Bandwidth input. LVCMOS/LVTTL interface levels.
23	CLK	Input	Pulldown	Non-inverting differential clock input.
24	nCLK	Input	Pullup/ Pulldown	Inverting differential clock input. V <sub>cc</sub> /2 default when left floating.
25	FS0	Input	Pullup	Frequency select pin. LVCMOS/LVTTL interface levels.
26, 27	PCIEXT0, PCIEXC0	Output		Differential output pairs. LVPECL interface levels.

NOTE: *Pullup* and *Pulldown* refer to internal input resistors. See Table 2, Pin Characteristics, for typical values.

NOTE: Electrical parameters are guaranteed over the specified ambient operating temperature range, which is established when the device is mounted in a test socket with maintained transverse airflow greater than 500 lfm. The device will meet specifications after thermal equilibrium has been reached under these conditions.

NOTE 1: Defined as skew between outputs at the same supply voltage and with equal load conditions.

Measured at the output differential cross points.

NOTE 2: This parameter is defined in accordance with JEDEC Standard 65.

NOTE 3: Please refer to the Phase Noise Plot following this section.

## TYPICAL PHASE NOISE AT 100MHz

The illustrated phase noise plot was taken using a low phase noise signal generator, the noise floor of the signal generator is less than that of the device under test.

Using this configuration allows one to see the true spectral purity or phase noise performance of the PLL in the device under test.

Due to the tracking ability of a PLL, it will track the input signal up to its loop bandwidth. Therefore, if the input phase noise is greater than that of the PLL, it will increase the output phase noise performance of the device. It is recommended that the phase noise performance of the input is verified in order to achieve the above phase noise performance.

## APPLICATION INFORMATION

### POWER SUPPLY FILTERING TECHNIQUES

As in any high speed analog circuitry, the power supply pins are vulnerable to random noise. To achieve optimum jitter performance, power supply isolation is required. The ICS9DB306 provides separate power supplies to isolate any high switching noise from the outputs to the internal PLL.  $V_{CC}$  and  $V_{CCA}$  should be individually connected to the power supply plane through vias, and  $0.01\mu\text{F}$  bypass capacitors should be used for each pin. *Figure 1* illustrates this for a generic  $V_{CC}$  pin and also shows that  $V_{CCA}$  requires that an additional  $24\Omega$  resistor along with a  $10\mu\text{F}$  bypass capacitor be connected to the  $V_{CCA}$  pin.

FIGURE 1. POWER SUPPLY FILTERING

### WIRING THE DIFFERENTIAL INPUT TO ACCEPT SINGLE ENDED LEVELS

*Figure 2* shows how the differential input can be wired to accept single ended levels. The reference voltage  $V_{REF} = V_{DD}/2$  is generated by the bias resistors  $R1$ ,  $R2$  and  $C1$ . This bias circuit should be located as close as possible to the input pin. The ratio

of  $R1$  and  $R2$  might need to be adjusted to position the  $V_{REF}$  in the center of the input voltage swing. For example, if the input clock swing is only  $2.5\text{V}$  and  $V_{CC} = 3.3\text{V}$ ,  $V_{REF}$  should be  $1.25\text{V}$  and  $R2/R1 = 0.609$ .

FIGURE 2. SINGLE ENDED SIGNAL DRIVING DIFFERENTIAL INPUT

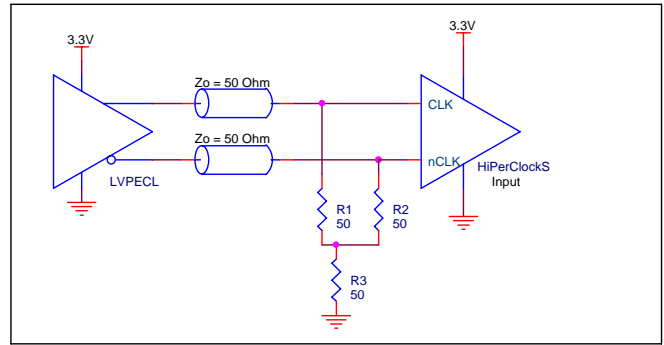

### DIFFERENTIAL CLOCK INPUT INTERFACE

The CLK /nCLK accepts LVDS, LVPECL, LVHSTL, SSTL, HCSTL and other differential signals. Both  $V_{SWING}$  and  $V_{OH}$  must meet the  $V_{PP}$  and  $V_{CMR}$  input requirements. Figures 3A to 3E show interface examples for the HiPerClockS CLK/nCLK input driven by the most common driver types. The input interfaces suggested here are

examples only. Please consult with the vendor of the driver component to confirm the driver termination requirements. For example in *Figure 3A*, the input termination applies for IDT HiPerClockS LVHSTL drivers. If you are using an LVHSTL driver from another vendor, use their termination recommendation.

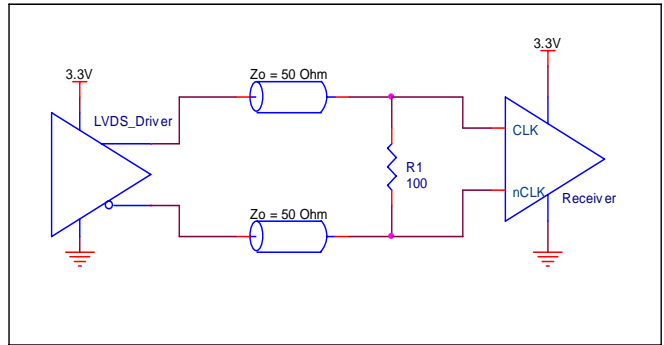

**FIGURE 3A. HiPerClockS CLK/nCLK INPUT DRIVEN BY IDT HiPerClockS LVHSTL DRIVER**

**FIGURE 3E. HiPerClockS CLK/nCLK INPUT DRIVEN BY 3.3V LVPECL DRIVER WITH AC COUPLE**

## TERMINATION FOR LVPECL OUTPUTS

The clock layout topology shown below is a typical termination for LVPECL outputs. The two different layouts mentioned are recommended only as guidelines.

The differential outputs are low impedance follower outputs that generate ECL/LVPECL compatible outputs. Therefore, terminating resistors (DC current path to ground) or current sources must be used for functionality. These outputs are de-

signed to drive 50Ω transmission lines. Matched impedance techniques should be used to maximize operating frequency and minimize signal distortion. *Figures 4A and 4B* show two different layouts which are recommended only as guidelines. Other suitable clock layouts may exist and it would be recommended that the board designers simulate to guarantee compatibility across all printed circuit and clock component process variations.

FIGURE 4A. LVPECL OUTPUT TERMINATION

FIGURE 4B. LVPECL OUTPUT TERMINATION

## RECOMMENDATIONS FOR UNUSED INPUT AND OUTPUT PINS

### INPUTS:

#### LVC MOS CONTROL PINS

All control pins have internal pullups or pulldowns; additional resistance is not required but can be added for additional protection. A 1kΩ resistor can be used.

### OUTPUTS:

#### LVPECL OUTPUTS

All unused LVPECL outputs can be left floating. We recommend that there is no trace attached. Both sides of the differential output pair should either be left floating or terminated.

**SCHEMATIC EXAMPLE**

Figure 5 shows an example of ICS9DB306 application schematic. In this example, the device is operated at  $V_{CC} = 3.3V$ . The decoupling capacitor should be located as close as possible to the power pin. The input is driven by a HCSL driver. For LVPECL

output drivers, one of terminations approaches is shown in this schematic. For additional termination approaches, please refer to the LVPECL Termination Application Note.

**FIGURE 5. EXAMPLE OF ICS9DB306 SCHEMATIC**

## POWER CONSIDERATIONS

This section provides information on power dissipation and junction temperature for the ICS9DB306. Equations and example calculations are also provided.

### 1. Power Dissipation.

The total power dissipation for the ICS9DB306 is the sum of the core power plus the power dissipated in the load(s). The following is the power dissipation for  $V_{CC} = 3.3V + 10\% = 3.63V$ , which gives worst case results.

**NOTE:** Please refer to Section 3 for details on calculating power dissipated in the load.

- Power (core)<sub>MAX</sub> =  $V_{CC,MAX} * I_{EE,MAX} = 3.63V * 135mA = 490.1mW$
- Power (outputs)<sub>MAX</sub> = **30mW/Loaded Output pair**  
If all outputs are loaded, the total power is  $6 * 30mW = 180mW$

$$\text{Total Power}_{MAX} (3.63V, \text{ with all outputs switching}) = 490.1mW + 180mW = 670.1mW$$

### 2. Junction Temperature.

Junction temperature at the junction of the bond wire and bond pad directly affects the reliability of the device. The maximum recommended junction temperature for HiPerClockS™ devices is 125°C. Limiting the internal transistor junction temperature, T<sub>j</sub>, to 125°C ensures that the bond wire and bond pad temperature remains below 125°C.

The equation for T<sub>j</sub> is as follows:  $T_j = \theta_{JA} * Pd\_total + T_A$

T<sub>j</sub> = Junction Temperature

$\theta_{JA}$  = Junction-to-Ambient Thermal Resistance

Pd<sub>total</sub> = Total Device Power Dissipation (example calculation is in section 1 above)

T<sub>A</sub> = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance  $\theta_{JA}$  must be used. Assuming a moderate air flow of 200 linear feet per minute and a multi-layer board, the appropriate value is 43.9°C/W per Table 6 below.

Therefore, T<sub>j</sub> for an ambient temperature of 70°C with all outputs switching is:

$$70^\circ\text{C} + 0.670\text{W} * 43.9^\circ\text{C}/\text{W} = 99.4^\circ\text{C}. \text{ This is well below the limit of } 125^\circ\text{C}.$$

This calculation is only an example. T<sub>j</sub> will obviously vary depending on the number of loaded outputs, supply voltage, air flow, and the type of board (single layer or multi-layer).

**TABLE 6. THERMAL RESISTANCE  $\theta_{JA}$  FOR 28-PIN TSSOP, FORCED CONVECTION**

	$\theta_{JA}$ by Velocity (Linear Feet per Minute)		
	0	200	500
Single-Layer PCB, JEDEC Standard Test Boards	82.9°C/W	68.7°C/W	60.5°C/W
Multi-Layer PCB, JEDEC Standard Test Boards	49.8°C/W	43.9°C/W	41.2°C/W

**NOTE:** Most modern PCB designs use multi-layered boards. The data in the second row pertains to most designs.

### 3. Calculations and Equations.

The purpose of this section is to derive the power dissipated into the load.

LVPECL output driver circuit and termination are shown in *Figure 6*.

**FIGURE 6. LVPECL DRIVER CIRCUIT AND TERMINATION**

To calculate worst case power dissipation into the load, use the following equations which assume a 50Ω load, and a termination voltage of  $V_{CC0} - 2V$ .

- For logic high,  $V_{OUT} = V_{OH\_MAX} = V_{CC0\_MAX} - 0.9V$

$$(V_{CC0\_MAX} - V_{OH\_MAX}) = 0.9V$$

- For logic low,  $V_{OUT} = V_{OL\_MAX} = V_{CC0\_MAX} - 1.7V$

$$(V_{CC0\_MAX} - V_{OL\_MAX}) = 1.7V$$

$Pd\_H$  is power dissipation when the output drives high.

$Pd\_L$  is the power dissipation when the output drives low.

$$Pd\_H = [(V_{OH\_MAX} - (V_{CC0\_MAX} - 2V))/R_L] * (V_{CC0\_MAX} - V_{OH\_MAX}) = [(2V - (V_{CC0\_MAX} - V_{OH\_MAX}))/R_L] * (V_{CC0\_MAX} - V_{OH\_MAX}) = [(2V - 0.9V)/50\Omega] * 0.9V = 19.8mW$$

$$Pd\_L = [(V_{OL\_MAX} - (V_{CC0\_MAX} - 2V))/R_L] * (V_{CC0\_MAX} - V_{OL\_MAX}) = [(2V - (V_{CC0\_MAX} - V_{OL\_MAX}))/R_L] * (V_{CC0\_MAX} - V_{OL\_MAX}) = [(2V - 1.7V)/50\Omega] * 1.7V = 10.2mW$$

Total Power Dissipation per output pair =  $Pd\_H + Pd\_L = 30mW$

REVISION HISTORY SHEET				
Rev	Table	Page	Description of Change	Date
A	T3F	2	Added PLL Mode Function Table.	4/7/05
B	T4A	3	Power Supply Table - minimum $V_{CCA}$ changed from 3.135V to $V_{CC} - 0.60V$ , and maximum set to $V_{CC}$ .	6/16/06
		6	Corrected <i>3.3V Output Load AC Test Circuit diagram</i> to correspond with Power Supply table.	
	8	Added <i>Recommendations for Unused Input and Output Pins</i> .		
	T9	15	Ordering Information Table - added lead-free SSOP part number.	
B		1	Features Section - added Input Frequency Range and VCO Range bullets.	7/14/06
C	T5	4	Changed power supply from $3.3V \pm 5\%$ to $3.3V \pm 10\%$ throughout the datasheet. AC Characteristics Table - changed Output Skew from 55ps typ./135ps max. to 25ps typ./100ps max. Changed Cycle-toCycle Jitter from 25ps max. to 30ps max. Changed Output Duty Cycle from 48% min./52% max. to 47% min./53% max.	9/22/06
		11	Power Considerations - correct Power Dissipation to coincide with the power supply change.	
C	T4C T5A - T5B	3	Differential DC Characteristics Table - updated notes.	8/13/09
		4	AC Characteristics Tables - added thermal note.	
		7	Power Supply Filtering Techniques - deleted last line " The 10ohm resistor can also be replaced by a ferrite bead."	
	8	Updated Differential Clock Input Interface section.		
	9	Updated Figures 4A and 4B.		
	T9	15	Ordering Information Table - deleted ICS prefix in Part/Order Number column. Added 28 Lead SSOP Lead-free marking.
