

12 BIT, 500 MSPS ANALOG-TO-DIGITAL CONVERTER

FEATURES

- **Controlled Baseline**
 - One Assembly/Test Site, One Fabrication Site
- **Extended Temperature Performance of –55°C to 125°C**
- **Enhanced Diminishing Manufacturing Sources (DMS) Support**
- **Enhanced Product-Change Notification**
- **Qualification Pedigree ⁽¹⁾**
- **500-MSPS Sample Rate**
- **12 Bit Resolution, 10.5 Bits Effective Number of Bits (ENOB)**
- **2 GHz Input Bandwidth**

(1) Component qualification in accordance with JEDEC and industry standards to ensure reliable operation over an extended temperature range. This includes, but is not limited to, Highly Accelerated Stress Test (HAST) or biased 85/85, temperature cycle, autoclave or unbiased HAST, electromigration, bond intermetallic life, and mold compound life. Such qualification testing should not be viewed as justifying use of this component beyond specified performance and environmental limits.

- **SFDR = 75 dBc at 450 MHz and 500 MSPS**
- **SNR = 64.6 dBFS at 450 MHz and 500 MSPS**
- **2.2 Vpp Differential Input Voltage**
- **LVDS-Compatible Outputs**
- **Total Power Dissipation: 2.2 W**
- **Offset Binary Output Format**
- **Output Data Transitions on the Rising and Falling Edges of a Half-Rate Output Clock**
- **On-Chip Analog Buffer, Track and Hold, and Reference Circuit**
- **80 Pin TQFP PowerPAD™ Package (14 mm × 14 mm)**
- **Pin Similar to ADS5440/ADS5444**

APPLICATIONS

- **Test and Measurement Instrumentation**
- **Software-Defined Radio**
- **Data Acquisition**
- **Power Amplifier Linearization**
- **Communication Instrumentation**
- **Radar**

DESCRIPTION/ORDERING INFORMATION

The ADS5463 is a 12 bit, 500 MSPS analog-to-digital converter (ADC) that operates from both a 5 V supply and 3.3 V supply, while providing LVDS-compatible digital outputs. The ADS5463 input buffer isolates the internal switching of the onboard track and hold (T&H) from disturbing the signal source while providing a high impedance input. An internal reference generator also is provided to simplify the system design.

Designed to optimize conversion of wide-bandwidth signals up to 500 MHz of input frequency at 500 MSPS, the ADS5463 has outstanding low noise and linearity over a large input frequency range. Input signals above 500 MHz also can be converted due to the large input bandwidth of the device.

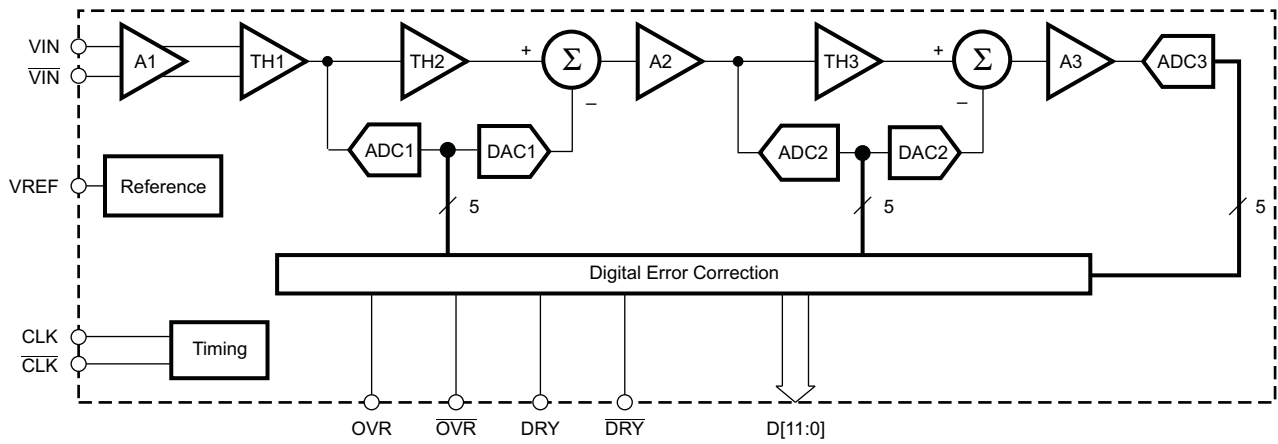

The ADS5463 is available in an 80-pin TQFP PowerPAD™ package. The ADS5463 is built on state-of-the-art Texas Instruments complementary bipolar process (BiCom3X) and is specified over the full extended temperature range (–55°C to 125°C).

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PowerPAD is a trademark of Texas Instruments.

All other trademarks are the property of their respective owners.

B0061-03

Figure 1. Analog-to-Digital Converter Functional Block Diagram

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

PACKAGE/ORDERING INFORMATION⁽¹⁾

| PRODUCT | PACKAGE LEAD | PACKAGE DESIGNATOR ⁽²⁾ | SPECIFIED TEMPERATURE RANGE | PACKAGE MARKING | ORDERING NUMBER | TRANSPORT MEDIA, QUANTITY |
|------------|-------------------------------------|-----------------------------------|-----------------------------|-----------------|-----------------|---------------------------|
| ADS5463-EP | HTQFP-80 ⁽³⁾ PowerPAD | PFP | –55°C to 125°C | ADS5463MEP | ADS5463MPFPEP | Tray, 96 |

(1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI website at www.ti.com.

(2) Package drawings, thermal data, and symbolization are available at www.ti.com/packaging.

(3) Thermal pad size: 9.5 mm × 9.5 mm (minimum), 10 mm × 10 mm (maximum).

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

| | | ADS5463 | UNIT |
|------------------------------|--------------|---------------------|------|
| Supply voltage | AVDD5 to GND | 6 | V |
| | AVDD3 to GND | 5 | V |
| | DVDD3 to GND | 5 | V |
| Analog input to GND | | –0.3 to AVDD5 + 0.3 | V |
| Clock input to GND | | –0.3 to AVDD5 + 0.3 | V |
| CLK to CLK | | ±2.5 | V |
| Digital data output to GND | | –0.3 to DVDD3 + 0.3 | V |
| Operating temperature range | | –55 to 125 | °C |
| Maximum junction temperature | | 150 | °C |
| Storage temperature range | | –65 to 150 | °C |
| ESD Human Body Model (HBM) | | 2 | kV |

(1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not implied.

THERMAL CHARACTERISTICS⁽¹⁾

| PARAMETER | TEST CONDITIONS | TYP | UNIT |
|---------------------------------|---------------------------------------|------|------|
| ⁽²⁾ R _{θJA} | Soldered thermal pad, no airflow | 23.7 | °C/W |
| | Soldered thermal pad, 150 LFM airflow | 17.8 | |
| | Soldered thermal pad, 250 LFM airflow | 16.4 | |
| ⁽³⁾ R _{θJP} | Bottom of package (thermal pad) | 2.99 | °C/W |

(1) Using 36 thermal vias (6 × 6 array). See *Application Information* section.

(2) R_{θJA} is the thermal resistance from junction to ambient.

(3) R_{θJP} is the thermal resistance from junction to the thermal pad.

Long-term high-temperature storage and/or extended use at maximum recommended operating conditions may result in a reduction of overall device life. See Figure 1 for additional information on thermal derating. Electromigration failure mode applies to powered part. Kirkendall voiding failure mode is a function of temperature only.

Figure 2. ADS5463-EP Operating Life Derating Chart

RECOMMENDED OPERATING CONDITIONS

| | | MIN | TYP | MAX | UNIT |
|--|---|------|-----|------|-----------------|
| SUPPLIES | | | | | |
| AVDD5 | Analog supply voltage | 4.75 | 5 | 5.25 | V |
| AVDD3 | Analog supply voltage | 3 | 3.3 | 3.6 | V |
| DVDD3 | Output driver supply voltage | 3 | 3.3 | 3.6 | V |
| ANALOG INPUT | | | | | |
| | Differential input range | | 2.2 | | V _{pp} |
| V _{CM} | Input common mode | | 2.4 | | V |
| DIGITAL OUTPUT (DRY, DATA, OVR) | | | | | |
| | Maximum differential output load | | 10 | | pF |
| CLOCK INPUT (CLK) | | | | | |
| | CLK input sample rate (sine wave) | 20 | | 500 | MSPS |
| | Clock amplitude, differential sine wave | | 3 | | V _{pp} |
| | Clock duty cycle | | 50% | | |
| T _A | Open free-air temperature | -55 | | 125 | °C |

ELECTRICAL CHARACTERISTICS

Typical values at T_A = 25°C, minimum and maximum values over full temperature range T_{MIN} = -55°C to T_{MAX} = 125°C, sampling rate = 500 MSPS, 50% clock duty cycle, AVDD5 = 5 V, AVDD3 = 3.3 V, DVDD3 = 3.3 V, -1 dBFS differential input, and 3 V_{PP} differential clock (unless otherwise noted)

| PARAMETER | | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|-----------------------------------|--------------------------------|--|-------|-----------|-------|-----------------|
| Resolution | | | | 12 | | Bits |
| ANALOG INPUTS | | | | | | |
| | Differential input range | | | 2.2 | | V _{pp} |
| V _{CM} | Input common mode | | | 2.4 | | V |
| | Input resistance (dc) | Each input to ground | | 500 | | Ω |
| | Input capacitance | Each input to ground | | 2.5 | | pF |
| | Analog input bandwidth (-3 dB) | Dependent on source impedance | | 2 | | GHz |
| CMRR | Common Mode Rejection Ratio | Common Mode Signal = 10MHz | | 80 | | dB |
| INTERNAL REFERENCE VOLTAGE | | | | | | |
| VREF | Reference voltage | | | 2.4 | | V |
| DYNAMIC ACCURACY | | | | | | |
| | No missing codes | | | Assured | | |
| DNL | Differential linearity error | f _{IN} = 10 MHz | -0.95 | ±0.25 | 0.95 | LSB |
| INL | Integral linearity error | f _{IN} = 10 MHz | -2.5 | +0.8/-0.3 | 2.5 | LSB |
| | Offset error | | -11 | | 11 | mV |
| | Offset temperature coefficient | | | 0.0005 | | mV/°C |
| | Gain error | | -5.2 | | 5.2 | %FS |
| | Gain temperature coefficient | | | -0.02 | | Δ%/°C |
| | PSRR | 100kHz supply noise (see Figure 34) | | 85 | | dB |
| POWER SUPPLY | | | | | | |
| I _{AVDD5} | 5-V analog supply current | V _{IN} = full scale, f _{IN} = 10 MHz, f _S = 500 MSPS | | 300 | 365 | mA |
| I _{AVDD3} | 3.3-V analog supply current | | | 125 | 145 | mA |
| I _{DVDD3} | 3.3-V digital supply current | | | 82 | 92 | mA |
| | Total Power dissipation | | | 2.18 | 2.575 | W |
| | Power-up time | | | 200 | | μs |
| DYNAMIC AC CHARACTERISTICS | | | | | | |

ELECTRICAL CHARACTERISTICS (continued)

Typical values at $T_A = 25^\circ\text{C}$, minimum and maximum values over full temperature range $T_{\text{MIN}} = -55^\circ\text{C}$ to $T_{\text{MAX}} = 125^\circ\text{C}$, sampling rate = 500 MSPS, 50% clock duty cycle, AVDD5 = 5 V, AVDD3 = 3.3 V, DVDD3 = 3.3 V, -1 dBFS differential input, and 3 V_{PP} differential clock (unless otherwise noted)

| PARAMETER | | TEST CONDITIONS | | MIN | TYP | MAX | UNIT |
|---------------------------|-----------------------------|---------------------------|------|-------|------|-----|------|
| SNR | Signal-to-noise ratio | f _{IN} = 10 MHz | | | 65.3 | | dBFS |
| | | f _{IN} = 70 MHz | | | 65.4 | | |
| | | f _{IN} = 100 MHz | 25C | 63.5 | 65.3 | | |
| | | | Temp | 63 | 65.3 | | |
| | | f _{IN} = 230 MHz | | | 65.1 | | |

Figure 3. Timing Diagram

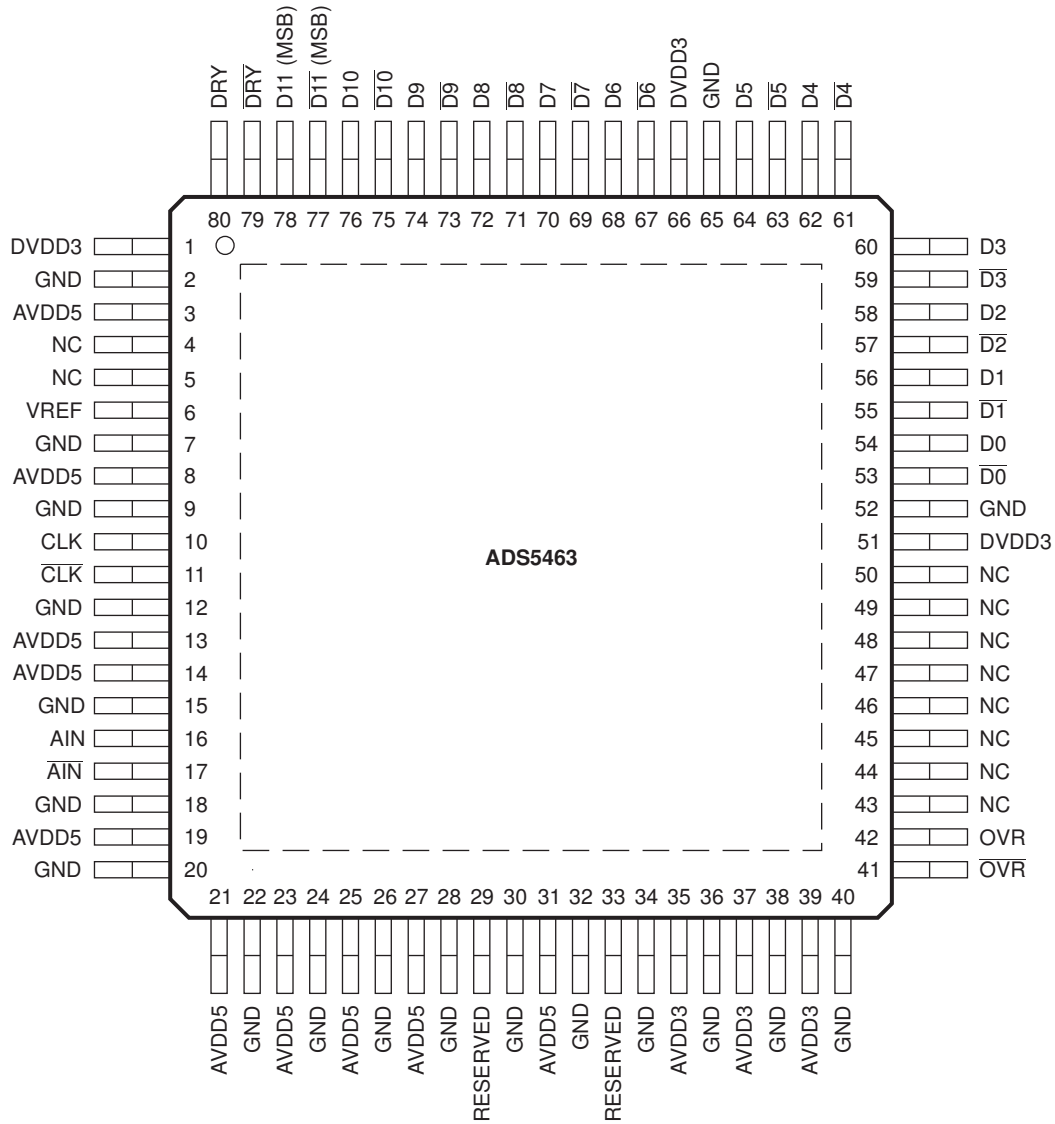

TIMING CHARACTERISTICS⁽¹⁾

Typical values at $T_A = 25^\circ\text{C}$, sampling rate = 500 MSPS, 50% clock duty cycle, AVDD5 = 5 V, AVDD3 = 3.3 V, DVDD3 = 3.3 V, and 3 V_{PP} differential clock (unless otherwise noted)

| PARAMETER | | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|-------------------|--------------------------------------|--|-----|------|-----|--------|
| t _A | Aperture delay | | | 200 | | ps |
| | Aperture jitter, rms | | | 160 | | fs |
| | Latency | | | 3.5 | | cycles |
| t _{CLK} | Clock period | | 2 | | | ns |
| t _{CLKH} | Clock pulse duration, high | | 1 | | | ns |
| t _{CLKL} | Clock pulse duration, low | | 1 | | | ns |
| t _{DRY} | CLK to DRY delay ⁽¹⁾ | Zero crossing, 7 pF diff loading | | 1100 | | ps |
| t _{DATA} | CLK to DATA/OVR delay ⁽¹⁾ | Zero crossing, 7 pF diff loading | | 1100 | | ps |
| t _{SKEW} | DRY to DATA skew | t _{DATA} – t _{DRY} , 7 pF diff loading | | 0 | | ps |
| t _{RISE} | DRY/DATA/OVR rise time | 7 pF differential loading | | 500 | | ps |
| t _{FALL} | DRY/DATA/OVR fall time | 7 pF differential loading | | 500 | | ps |

(1) DRY, DATA, and OVR are updated on the falling edge of CLK. The latency must be added to t_{DATA} to determine the data propagation delay.

Table 1. TERMINAL FUNCTIONS

| TERMINAL | | DESCRIPTION |
|---|--|--|
| NAME | NO. | |
| AIN | 16 | Differential input signal (positive) |
| $\overline{\text{AIN}}$ | 17 | Differential input signal (negative) |
| AVDD5 | 3, 8, 13, 14, 19, 21, 23, 25, 27, 31 | Analog power supply (5 V) |
| AVDD3 | 35, 37, 39 | Analog power supply (3.3 V) (Suggestion for ≤ 250 MSPS: leave option to connect to 5 V for ADS5440/4 compatibility) |
| DVDD3 | 1, 51, 66 | Output driver power supply (3.3 V) |
| GND | 2, 7, 9, 12, 15, 18, 20, 22, 24, 26, 28, 30, 32, 34, 36, 38, 40, 52, 65 | Ground |
| CLK | 10 | Differential input clock (positive). Conversion is initiated on rising edge. |
| $\overline{\text{CLK}}$ | 11 | Differential input clock (negative) |
| D0, $\overline{\text{D0}}$ | 54, 53 | LVDS digital output pair, least-significant bit (LSB) |
| D1–D10, $\overline{\text{D1}}\text{--}\overline{\text{D10}}$ | 55–64, 67–76 | LVDS digital output pairs |
| D11, $\overline{\text{D11}}$ | 78, 77 | LVDS digital output pair, most-significant bit (MSB) |
| DRY, $\overline{\text{DRY}}$ | 80, 79 | Data ready LVDS output pair |
| NC | 4, 5, 43–50 | No connect (4 and 5 should be left floating, 43–50 are possible future bit additions for this pinout and therefore can be connected to a digital bus or left floating) |
| OVR, $\overline{\text{OVR}}$ | 42, 41 | Overrange indicator LVDS output. A logic high signals an analog input in excess of the full-scale range. |
| RESERVED | 29, 33 | Pin 29 is reserved for possible future Vcm output for this pinout; pin 33 is reserved for possible future power-down control pin for this pinout. |
| VREF | 6 | Reference voltage |

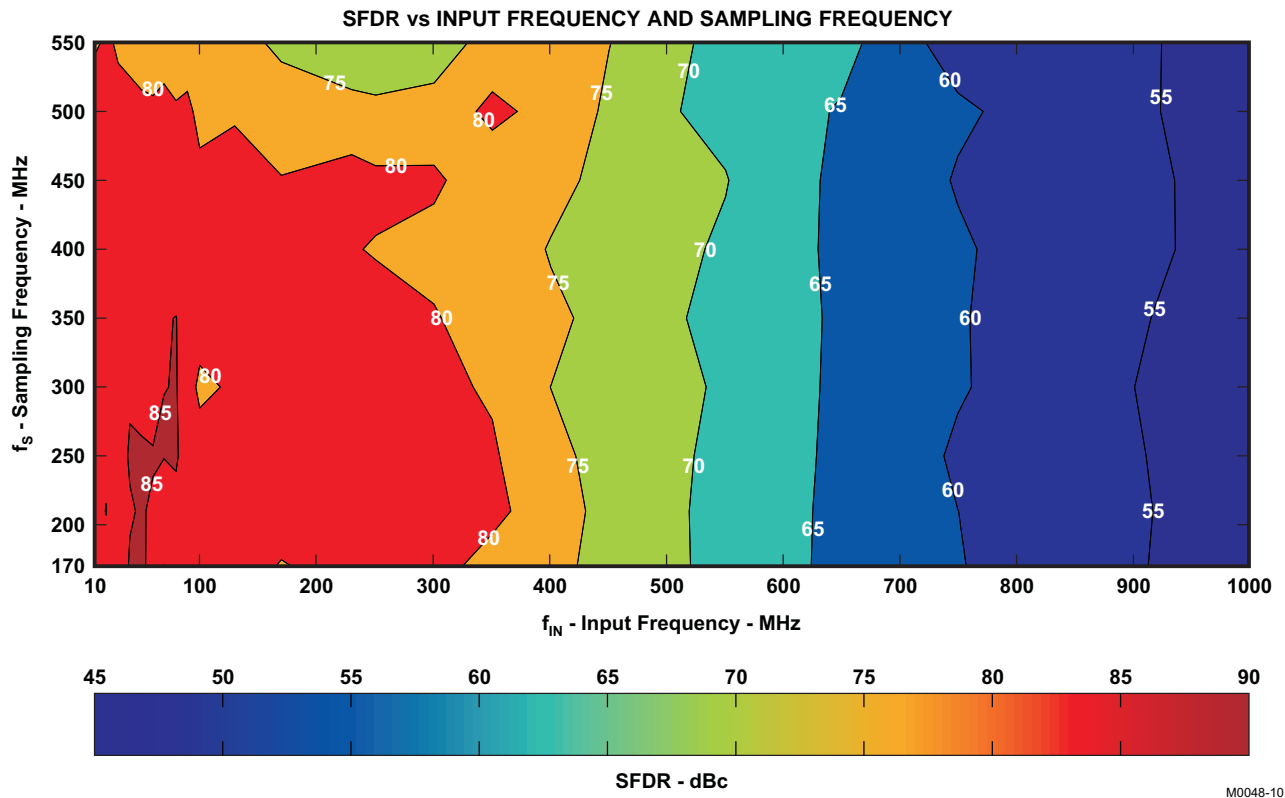

Figure 37.

APPLICATION INFORMATION

Theory of Operation

The ADS5463 is a 12 bit, 500-MSPS, monolithic-pipeline, analog-to-digital converter. Its bipolar analog core operates from 5 V and 3.3 V supplies, while the output uses a 3.3 V supply to provide LVDS-compatible outputs. The conversion process is initiated by the rising edge of the external input clock. At that instant, the differential input signal is captured by the input track-and-hold (T&H), and the input sample is sequentially converted by a series of lower resolution stages, with the outputs combined in a digital correction logic block. Both the rising and the falling clock edges are used to propagate the sample through the pipeline every half clock cycle. This process results in a data latency of 3.5 clock cycles, after which the output data is available as a 12-bit parallel word, coded in offset binary format.

Input Configuration

The analog input for the ADS5463 consists of an analog pseudodifferential buffer followed by a bipolar transistor track-and-hold. The analog buffer isolates the source driving the input of the ADC from any internal switching. The input common mode is set internally through a 500- Ω resistor connected from 2.4 V to each of the inputs. This results in a differential input impedance of 1 k Ω .

For a full-scale differential input, each of the differential lines of the input signal (pins 16 and 17) swings symmetrically between 2.4 V + 0.55 V and 2.4 V – 0.55 V. This means that each input has a maximum signal swing of 1.1 V_{pp} for a total differential input signal swing of 2.2 V_{pp}. The maximum swing is determined by the internal reference voltage generator, eliminating the need for any external circuitry for this purpose.

The ADS5463 obtains optimum performance when the analog inputs are driven differentially. The circuit in [Figure 38](#) shows one possible configuration using an RF transformer with termination either on the primary or on the secondary of the transformer. In addition, the evaluation module is configured with two back-to-back transformers, which also demonstrates good performance. If voltage gain is required, a step-up transformer can be used.

Besides the transformer configurations, Texas Instruments offers a wide selection of single-ended operational amplifiers that can be selected depending on the application. An RF gain-block amplifier, such as Texas Instruments' THS9001, can also be used for high-input-frequency applications. For large voltage gains at intermediate-frequencies in the 50 MHz to 500 MHz range, the configuration shown in [Figure 39](#) can be used. The component values can be tuned for different intermediate frequencies. The example shown is located on the evaluation module and is tuned for an IF of 170 MHz. More information regarding this configuration can be found in the *ADS5463 EVM User Guide* ([SLAU194](#)) and the *THS9001 50 MHz to 350 MHz Cascadeable Amplifier* data sheet ([SLOS426](#)).

Figure 38. Converting a Single-Ended Input to a Differential Signal Using an RF Transformer

S0177-03

Figure 39. Using the THS9001 IF Amplifier With the ADS5463

S0193-02

Figure 40. Using the THS4509 With the ADS5463

For applications requiring dc-coupling with the signal source, a differential input/differential output amplifier like the THS4509 (see Figure 40) is a good solution, as it minimizes board space and reduces the number of components.

In this configuration, the THS4509 amplifier circuit provides 10 dB of gain, converts the single-ended input to differential, and sets the proper input common-mode voltage to the ADS5463. The 50 Ω resistors and 18 pF capacitor between the THS4509 outputs and ADS5463 inputs (along with the input capacitance of the ADC) limit the bandwidth of the signal to about 70 MHz (–3 dB). Input termination is accomplished via the 78.9 Ω resistor and 0.22 μF capacitor to ground, in conjunction with the input impedance of the amplifier circuit. A 0.22 μF capacitor and 49.9-Ω resistor are inserted to ground across the 78.9 Ω resistor and 0.22 μF capacitor on the alternate input to balance the circuit. Gain is a function of the source impedance, termination, and 348 Ω feedback resistor. See the THS4509 data sheet for further component values to set proper 50 Ω termination for other common gains. Because the ADS5463 recommended input common-mode voltage is 2.4 V, the THS4509 is operated from a single power supply input with $V_{S+} = 5\text{ V}$ and $V_{S-} = 0\text{ V}$ (ground). This maintains maximum headroom on the internal transistors of the THS4509.

Clock Inputs

The ADS5463 clock input can be driven with either a differential clock signal or a single-ended clock input, with little or no difference in performance between both configurations. In low-input-frequency applications, where jitter may not be a big concern, the use of a single-ended clock (see Figure 41) could save some cost and board space without any trade-off in performance. When clocked with this configuration, it is best to connect $\overline{\text{CLK}}$ to ground with a 0.01 μF capacitor, while CLK is ac-coupled with a 0.01 μF capacitor to the clock source, as shown in Figure 41.

Figure 41. Single-Ended Clock

Figure 42. Differential Clock

For jitter-sensitive applications, the use of a differential clock has some advantages (as with any other ADC) at the system level. The differential clock allows for common-mode noise rejection at the PCB level. With a differential clock, the signal-to-noise ratio of the ADC is better for high intermediate frequency applications because the board clock jitter is superior.

A differential clock also allows for the use of bigger clock amplitudes without exceeding the absolute maximum ratings. In the case of a sinusoidal clock, this results in higher slew rates and reduces the impact of clock noise on jitter. [Figure 42](#) shows this approach. See *Clocking High Speed Data Converters (SLYT075)* for more details.

The common-mode voltage of the clock inputs is set internally to 2.4 V using internal 1 k Ω resistors. It is recommended to use ac coupling, but if this scheme is not possible due to, for instance, asynchronous clocking, the ADS5463 features good tolerance to clock common-mode variation (see [Figure 26](#) and [Figure 27](#)). Additionally, the internal ADC core uses both edges of the clock for the conversion process. Ideally, a 50% duty-cycle clock signal should be provided.

Digital Outputs

The ADC provides 12 data outputs (D11 to D0, with D11 being the MSB and D0 the LSB), a data-ready signal (DRY), and an overrange indicator (OVR) that equals a logic high when the output reaches the full-scale limits. The output format is offset binary. It is recommended to use the DRY signal to capture the output data of the ADS5463. DRY is source-synchronous to the DATA/OVR bits and operates at the same frequency, creating a half-rate DDR interface that updates data on both the rising and falling edges of DRY. The ADS5463 digital outputs are LVDS-compatible. Due to the high data rates, care should be taken not to overload the digital outputs with too much capacitance, which shortens the data-valid timing window. The values given for timing were obtained with a measured 14 pF parasitic board capacitance to ground on each LVDS line (or 7 pF differential parasitic capacitance).

Power Supplies

The use of low-noise power supplies with adequate decoupling is recommended. Linear supplies are the preferred choice versus switched ones, which tend to generate more noise components that can be coupled to the ADS5463. The ADS5463 uses three power supplies. For the analog portion of the design, a 5-V and 3.3-V AVDD is used, while the digital portion uses a 3.3 V supply (DVDD). All the ground pins are marked as GND, although analog and digital grounds are not tied together inside the package. The PSRR value and plot given were obtained by calibrating out the effect of the supply decoupling capacitors. With the decoupling capacitors in place, the board-level PSRR is actually much higher than the stated value for the ADC.

Layout Information

The evaluation board represents a good guideline of how to lay out the board to obtain the maximum performance from the ADS5463. General design rules, such as the use of multilayer boards, single ground plane for ADC ground connections, and local decoupling ceramic chip capacitors, should be applied. The input traces should be isolated from any external source of interference or noise, including the digital outputs as well as the clock traces. The clock signal traces also should be isolated from other signals, especially in applications where low jitter is required like high IF sampling. Besides performance-oriented rules, care must be taken when considering the heat dissipation of the device. The thermal heat sink should be soldered to the board as described in the [PowerPad Package](#) section. See *ADS5463 EVM User Guide (SLAU194)* on the TI Web site for the evaluation board schematic.

PowerPAD Package

The PowerPAD package is a thermally enhanced standard-size IC package designed to eliminate the use of bulky heatsinks and slugs traditionally used in thermal packages. This package can be easily mounted using standard printed circuit board (PCB) assembly techniques, and can be removed and replaced using standard repair procedures.

The PowerPAD package is designed so that the leadframe die pad (or thermal pad) is exposed on the bottom of the IC. This provides an extremely low thermal resistance path between the die and the exterior of the package. The thermal pad on the bottom of the IC can then be soldered directly to the printed circuit board (PCB), using the PCB as a heatsink.

Assembly Process

1. Prepare the PCB top-side etch pattern including etch for the leads as well as the thermal pad as illustrated in the *Mechanical Data* section.
2. Place a 6-by-6 array of thermal vias in the thermal pad area. These holes should be 13 mils in diameter. The small size prevents wicking of the solder through the holes.
3. It is recommended to place a small number of 25 mil diameter holes under the package, but outside the thermal pad area, to provide an additional heat path.
4. Connect all holes (both those inside and outside the thermal pad area) to an internal copper plane (such as a ground plane).
5. Do not use the typical web or spoke via-connection pattern when connecting the thermal vias to the ground plane. The spoke pattern increases the thermal resistance to the ground plane.
6. The top-side solder mask should leave exposed the terminals of the package and the thermal pad area.
7. Cover the entire bottom side of the PowerPAD vias to prevent solder wicking.
8. Apply solder paste to the exposed thermal pad area and all of the package terminals.

For more detailed information regarding the PowerPAD package and its thermal properties, see either the *PowerPAD Made Easy* application brief ([SLMA004](#)) or the *PowerPAD Thermally Enhanced Package* application report ([SLMA002](#)).

DEFINITION OF SPECIFICATIONS

Analog Bandwidth

The analog input frequency at which the power of the fundamental is reduced by 3 dB with respect to the low-frequency value

Aperture Delay

The delay in time between the rising edge of the input sampling clock and the actual time at which the sampling occurs

Aperture Uncertainty (Jitter)

The sample-to-sample variation in aperture delay

Clock Pulse Duration/Duty Cycle

The duty cycle of a clock signal is the ratio of the time the clock signal remains at a logic high (clock pulse duration) to the period of the clock signal, expressed as a percentage.

Differential Nonlinearity (DNL)

An ideal ADC exhibits code transitions at analog input values spaced exactly 1 LSB apart. DNL is the deviation of any single step from this ideal value, measured in units of LSB.

Common-Mode Rejection Ratio (CMRR)

CMRR measures the ability to reject signals that are presented to both analog inputs simultaneously. The injected common-mode frequency level is translated into dBFS, the spur in the output FFT is measured in dBFS, and the difference is the CMRR in dB.

Effective Number of Bits (ENOB)

ENOB is a measure in units of bits of a converter's performance as compared to the theoretical limit based on quantization noise

$$\text{ENOB} = (\text{SINAD} - 1.76)/6.02$$

Gain Error

Gain error is the deviation of the ADC actual input full-scale range from its ideal value, given as a percentage of the ideal input full-scale range.

Integral Nonlinearity (INL)

INL is the deviation of the ADC transfer function from a best-fit line determined by a least-squares curve fit of that transfer function. The INL at each analog input value is the difference between the actual transfer function and this best-fit line, measured in units of LSB.

Offset Error

Offset error is the deviation of output code from mid-code when both inputs are tied to common-mode.

Power-Supply Rejection Ratio (PSRR)

PSRR is a measure of the ability to reject frequencies present on the power supply. The injected frequency level is translated into dBFS, the spur in the output FFT is measured in dBFS, and the difference is the PSRR in dB. The measurement calibrates out the benefit of the board supply decoupling capacitors.

Signal-to-Noise Ratio (SNR)

SNR is the ratio of the power of the fundamental (P_S) to the noise floor power (P_N), excluding the power at dc and in the first five harmonics.

$$\text{SNR} = 10\log_{10} \frac{P_S}{P_N} \quad (2)$$

SNR is given either in units of dBc (dB to carrier) when the absolute power of the fundamental is used as the reference, or dBFS (dB to full scale) when the power of the fundamental is extrapolated to the converter's full-scale range.

Signal-to-Noise and Distortion (SINAD)

SINAD is the ratio of the power of the fundamental (P_S) to the power of all the other spectral components including noise (P_N) and distortion (P_D), but excluding dc.

$$\text{SINAD} = 10\log_{10} \frac{P_S}{P_N + P_D} \quad (3)$$

SINAD is given either in units of dBc (dB to carrier) when the absolute power of the fundamental is used as the reference, or dBFS (dB to full scale) when the power of the fundamental is extrapolated to the converter's full-scale range.

Temperature Drift

Temperature drift (with respect to gain error and offset error) specifies the change from the value at the nominal temperature to the value at T_{MIN} or T_{MAX} . It is computed as the maximum variation the parameters over the whole temperature range divided by $T_{\text{MIN}} - T_{\text{MAX}}$.

Total Harmonic Distortion (THD)

THD is the ratio of the power of the fundamental (P_S) to the power of the first five harmonics (P_D).

$$\text{THD} = 10\log_{10} \frac{P_S}{P_D} \quad (4)$$

THD is typically given in units of dBc (dB to carrier).

Two-Tone Intermodulation Distortion (IMD3)

IMD3 is the ratio of the power of the fundamental (at frequencies f_1 , f_2) to the power of the worst spectral component at either frequency $2f_1 - f_2$ or $2f_2 - f_1$. IMD3 is given in units of either dBc (dB to carrier) when the absolute power of the fundamental is used as the reference, or dBFS (dB to full scale) when the power of the fundamental is extrapolated to the converter's full-scale range.

PACKAGING INFORMATION

| Orderable Device | Status ⁽¹⁾ | Package Type | Package Drawing | Pins | Package Qty | Eco Plan ⁽²⁾ | Lead/Ball Finish | MSL Peak Temp ⁽³⁾ |
|------------------|-----------------------|--------------|-----------------|------|-------------|-------------------------|------------------|------------------------------|
| ADS5463MPFPEP | ACTIVE | HTQFP | PFP | 80 | 96 | Green (RoHS & no Sb/Br) | CU NIPDAU | Level-3-260C-168 HR |
| V62/07607-01XE | ACTIVE | HTQFP | PFP | 80 | 96 | Green (RoHS & no Sb/Br) | CU NIPDAU | Level-3-260C-168 HR |

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

PFP (S-PQFP-G80)

PowerPAD™ PLASTIC QUAD FLATPACK

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Body dimensions do not include mold flash or protrusion
 - This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at www.ti.com <<http://www.ti.com>>.
 - Falls within JEDEC MS-026

PowerPAD is a trademark of Texas Instruments.

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

NOTE: All linear dimensions are in millimeters

PFP (S-PQFP-G80) PowerPAD™

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
 - D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002, SLMA004, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>. Publication IPC-7351 is recommended for alternate designs.
 - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.
 - F. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
