

32K/64Kx18 Low Voltage Deep Sync FIFOs

Features

- 3.3V operation for low power consumption and easy integration into low voltage systems
- High speed, low power, first-in first-out (FIFO) memories
- 8K x 18 (CY7C4255V)
- 16K x 18 (CY7C4265V)
- 32K x 18 (CY7C4275V)
- 64K x 18 (CY7C4285V)
- 0.35 micron CMOS for optimum speed and power
- High speed 100 MHz operation (10 ns read/write cycle times)
- Low power
 - I_{CC} = 30 mA
 - I_{SB} = 4 mA
- Fully asynchronous and simultaneous read and write operation
- Empty, Full, Half Full, and programmable Almost Empty and Almost Full status flags
- Retransmit function
- Output Enable (\overline{OE}) pin
- Independent read and write enable pins
- Supports free running 50% duty cycle clock inputs
- Width Expansion Capability
- Depth Expansion Capability
- 64-pin 10x10 STQFP
- Pin compatible density upgrade to CY7C42X5V-ASC families
- Pin compatible 3.3V solutions for CY7C4255/65/75/85

Functional Description

The CY7C4255/65/75/85V are high speed, low power, first-in first-out (FIFO) memories with clocked read and write interfaces. All are 18 bits wide and are pin and functionally compatible to the CY7C42X5V Synchronous FIFO family. The CY7C4255/65/75/85V can be cascaded to increase FIFO depth. Programmable features include Almost Full/Almost Empty flags. These FIFOs provide solutions for a wide variety of data buffering needs, including high speed data acquisition, multiprocessor interfaces, and communications buffering.

These FIFOs have 18-bit input and output ports that are controlled by separate clock and enable signals. The input port is controlled by a free-running clock (WCLK) and a write enable pin (WEN).

When WEN is asserted, data is written into the FIFO on the rising edge of the WCLK signal. While WEN is held active, data is continually written into the FIFO on each cycle. The output port is controlled in a similar manner by a free-running read clock (RCLK) and a read enable pin (REN). In addition, the CY7C4255/65/75/85V have an output enable pin (OE). The read and write clocks may be tied together for single-clock operation or the two clocks may be run independently for asynchronous read or write applications. Clock frequencies up to 67 MHz are achievable.

Retransmit and Synchronous Almost Full/Almost Empty flag features are available on these devices.

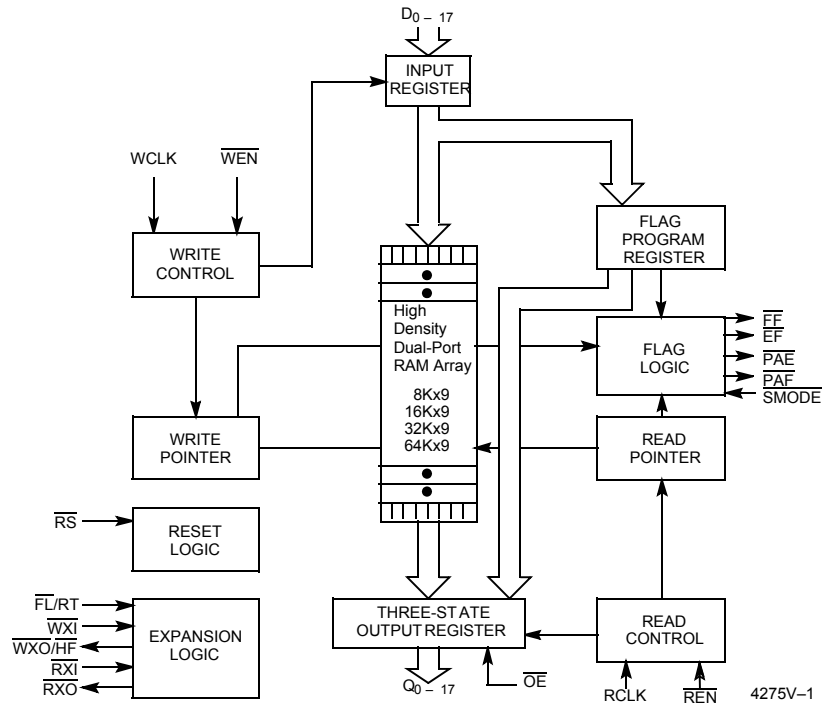

Depth expansion is possible using the cascade input (WXI, RXI), cascade output (WXO, RXO), and First Load (FL) pins. The WXO and RXO pins are connected to the WXI and RXI pins of the next device, and the WXO and RXO pins of the last device must be connected to the WXI and RXI pins of the first device. The FL pin of the first device is tied to VSS and the FL pin of all the remaining devices must be tied to VCC .

Table 1. Pin Definitions - CY7C4255V/65V/75V/85V 64-Pin STQFP

Signal Name	Description	IO	Function
D ₀₋₁₇	Data Inputs	I	Data inputs for an 18-bit bus.
Q ₀₋₁₇	Data Outputs	O	Data outputs for an 18-bit bus.
\overline{WEN}	Write Enable	I	Enables the WCLK input.
\overline{REN}	Read Enable	I	Enables the RCLK input.
WCLK	Write Clock	I	The rising edge clocks data into the FIFO when \overline{WEN} is LOW and the FIFO is not Full. When \overline{LD} is asserted, WCLK writes data into the programmable flag-offset register.
RCLK	Read Clock	I	The rising edge clocks data out of the FIFO when \overline{REN} is LOW and the FIFO is not Empty. When \overline{LD} is asserted, RCLK reads data out of the programmable flag-offset register.
$\overline{WXO}/\overline{HF}$	Write Expansion Out/Half Full Flag	O	Dual Mode Pin: Single device or width expansion – Half Full status flag____ Cascaded – Write Expansion Out signal, connected to WXI of next device
\overline{EF}	Empty Flag	O	When \overline{EF} is LOW, the FIFO is empty. \overline{EF} is synchronized to RCLK.
\overline{FF}	Full Flag	O	When \overline{FF} is LOW, the FIFO is full. \overline{FF} is synchronized to WCLK.
\overline{PAE}	Programmable Almost Empty	O	When \overline{PAE} is LOW, the FIFO is almost empty based on the almost empty offset value programmed into the FIFO. \overline{PAE} is asynchronous when V_{CC}/\overline{SMODE} is tied to V_{CC} . It is synchronized to RCLK when V_{CC}/\overline{SMODE} is tied to V_{SS} .
\overline{PAF}	Programmable Almost Full	O	When \overline{PAF} is LOW, the FIFO is almost full based on the almost full offset value programmed into the FIFO. \overline{PAF} is asynchronous when V_{CC}/\overline{SMODE} is tied to V_{CC} . It is synchronized to WCLK when V_{CC}/\overline{SMODE} is tied to V_{SS} .
\overline{LD}	Load	I	When \overline{LD} is LOW, D ₀₋₁₇ (Q ₀₋₁₇) are written (read) into (from) the programmable-flag-offset register.
$\overline{FL}/\overline{RT}$	First Load/Retransmit	I	Dual Mode Pin: Cascaded – The first device in the daisy chain has \overline{FL} tied to V_{SS} ; all other devices have \overline{FL} tied to V_{CC} . In standard mode or width expansion, \overline{FL} is tied to V_{SS} on all devices. Not Cascaded – Tied to V_{SS} . Retransmit function is also available in standalone mode by strobing RT.
\overline{WXI}	Write Expansion Input	I	Cascaded – Connected to \overline{WXO} of previous device Not Cascaded – Tied to V_{SS}
\overline{RXI}	Read Expansion Input	I	Cascaded – Connected to \overline{RXO} of previous device Not Cascaded – Tied to V_{SS}
\overline{RXO}	Read Expansion Output	O	Cascaded – Connected to \overline{RXI} of next device
\overline{RS}	Reset	I	Resets device to empty condition. A reset is required before an initial read or write operation after power up.
\overline{OE}	Output Enable	I	When OE is LOW, the FIFO's data outputs drive the bus to which they are connected. If OE is HIGH, the FIFO's outputs are in High Z (high-impedance) state.
V_{CC}/\overline{SMODE}	Synchronous Almost Empty/ Almost Full Flags	I	Dual Mode Pin: Asynchronous Almost Empty/Almost Full flags – tied to V_{CC} Synchronous Almost Empty/Almost Full flags – tied to V_{SS} (Almost Empty synchronized to RCLK, Almost Full synchronized to WCLK.)

Functional Description

The CY7C4255/65/75/85V provides five status pins. These pins are decoded to determine one of five states: Empty, Almost Empty, Half Full, Almost Full, and Full (see Table 3 on page 7). The Half Full flag shares the \overline{WXO} pin. This flag is valid in the standalone and width expansion configurations. In the depth expansion, this pin provides the expansion out (\overline{WXO}) information that is used to signal the next FIFO when it is to be activated.

The Empty and Full flags are synchronous, that is, they change state relative to either the read clock (RCLK) or the write clock (WCLK). When entering or exiting the Empty states, the flag is updated exclusively by the RCLK. The flag denoting Full states is updated exclusively by WCLK. The synchronous flag architecture guarantees that the flags remain valid from one clock cycle to the next. The Almost Empty/Almost Full flags become synchronous if the $V_{CC}/SMODE$ is tied to V_{SS} . All configurations are fabricated using an advanced 0.35 μ m CMOS technology. Input ESD protection is greater than 2001V, and latch-up is prevented by the use of guard rings.

Architecture

The CY7C4255/65/75/85V consists of an array of 8K/16K/32K/64K words of 18 bits each (implemented by a dual port array of SRAM cells), a read pointer, a write pointer, control signals (RCLK, WCLK, REN, WEN, RS), and flags (EF, PAE, HF, PAF, FF). The CY7C4255/65/75/85V also includes the control signals \overline{WXI} , \overline{RXI} , \overline{WXO} , \overline{RXO} for depth expansion.

Resetting the FIFO

Upon power up, the FIFO must be reset with a Reset (\overline{RS}) cycle. This causes the FIFO to enter the Empty condition signified by \overline{EF} being LOW. All data outputs go LOW after the falling edge of RS only if OE is asserted. For the FIFO to reset to its default state, the user must not read or write while RS is LOW.

FIFO Operation

When the \overline{WEN} signal is active (LOW), data present on the D_{0-17} pins is written into the FIFO on each rising edge of the WCLK signal. Similarly, when the \overline{REN} signal is active LOW, data in the FIFO memory is presented on the Q_{0-17} outputs. New data is presented on each rising edge of RCLK while REN is active LOW and OE is LOW. \overline{REN} must set up t_{ENS} before RCLK for it to be a valid read function. WEN must occur t_{ENS} before WCLK for it to be a valid write function.

An output enable (\overline{OE}) pin is provided to three-state the Q_{0-17} outputs when OE is deasserted. When OE is enabled (LOW), data in the output register is available to the Q_{0-17} outputs after t_{OE} . If devices are cascaded, the OE function only outputs data on the FIFO that is read enabled.

The FIFO contains overflow circuitry to disallow additional writes when the FIFO is full, and under flow circuitry to disallow additional reads when the FIFO is empty. An empty FIFO maintains the data of the last valid read on its Q_{0-17} outputs even after additional reads occur.

Note

1. The same selection sequence applies to reading from the registers. \overline{REN} is enabled and read is performed on the LOW-to-HIGH transition of RCLK.

Programming

The CY7C4255/65/75/85V devices contain two 16-bit offset registers. Data present on D_{0-15} during a program write determine the distance from Empty (Full) that the Almost Empty (Almost Full) flags become active. If the user elects not to program the FIFO's flags, the default offset values are used (see Table 3 on page 7). When the Load LD pin is set LOW and WEN is set LOW, data on the inputs D_{0-15} is written into the Empty offset register on the first LOW-to-HIGH transition of the write clock (WCLK). When the LD pin and \overline{WEN} are held LOW then data is written into the Full offset register on the second LOW-to-HIGH transition of the write clock (WCLK). The third transition of the write clock (WCLK) again writes to the Empty offset register (see Table 2). All offset registers do not have to be written at one time. One or two offset registers can be written and then, by bringing the LD pin HIGH, the FIFO is returned to normal read/write operation. When the LD pin is set LOW, and WEN is LOW, the next offset register in sequence is written.

The contents of the offset registers can be read on the output lines when the LD pin is set LOW and REN is set LOW. Then, data can be read on the LOW-to-HIGH transition of the read clock (RCLK).

Table 2. Write Offset Register

\overline{LD}	\overline{WEN}	WCLK ^[1]	Selection
0	0		Writing to offset registers: Empty Offset  Full Offset
0	1		No Operation
1	0		Write Into FIFO
1	1		No Operation

Flag Operation

The CY7C4255/65/75/85V devices provide five flag pins to indicate the condition of the FIFO contents. Empty and Full are synchronous. PAE and PAF are synchronous if $V_{CC}/SMODE$ is tied to V_{SS} .

Full Flag

The Full Flag (\overline{FF}) goes LOW when device is Full. Write operations are inhibited whenever FF is LOW regardless of the state of \overline{WEN} . \overline{FF} is synchronized to WCLK, that is, it is exclusively updated by each rising edge of WCLK.

Empty Flag

The Empty Flag (\overline{EF}) goes LOW when the device is empty. Read operations are inhibited whenever \overline{EF} is LOW, regardless of the state of REN. \overline{EF} is synchronized to RCLK, that is, it is exclusively updated by each rising edge of RCLK.

Programmable Almost Empty/Almost Full Flag

The CY7C4255/65/75/85V features programmable Almost Empty and Almost Full Flags. Each flag can be programmed (described in section [Programming](#) on page 6) a specific distance from the corresponding boundary flags (Empty or Full). When the FIFO contains the number of words or fewer for which

the flags have been programmed, the $\overline{\text{PAF}}$ or $\overline{\text{PAE}}$ is asserted, signifying that the FIFO is either Almost Full or Almost Empty. See [Table 3](#) for a description of programmable flags.

When the $\overline{\text{SMODE}}$ pin is tied LOW, the $\overline{\text{PAF}}$ flag signal transition is caused by the rising edge of the write clock and the $\overline{\text{PAE}}$ flag transition is caused by the rising edge of the read clock.

Table 3. Flag Truth Table

Number of Words in FIFO				$\overline{\text{FF}}$	$\overline{\text{PAF}}$	$\overline{\text{HF}}$	$\overline{\text{PAE}}$	$\overline{\text{EF}}$
7C4255V – 8K x 18	7C4265V – 16K x 18	7C4275V – 32K x 18	7C4285V – 64K x 18					
0	0	0	0	H	H	H	L	L
1 to $n^{[2]}$	1 to $n^{[2]}$	1 to $n^{[2]}$	1 to $n^{[2]}$	H	H	H	L	H
$(n+1)$ to 4096	$(n+1)$ to 8192	$(n+1)$ to 16384	$(n+1)$ to 32768	H	H	H	H	H
4097 to $(8192-(m+1))$	8193 to $(16384-(m+1))$	16385 to $(32768-(m+1))$	32769 to $(65536-(m+1))$	H	H	L	H	H
$(8192-m)^{[3]}$ to 8192	$(16384-m)^{[3]}$ to 16384	$(32768-m)^{[3]}$ to 32767	$(65536-m)^{[3]}$ to 65535	H	L	L	H	H
8192	16384	32768	65536	L	L	L	H	H

Retransmit

The retransmit feature is beneficial when transferring packets of data. It enables the receipt of data to be acknowledged by the receiver and retransmitted if necessary.

The Retransmit (RT) input is active in the standalone and width expansion modes. The retransmit feature is intended for use when a number of writes equal to or less than the depth of the FIFO have occurred and at least one word has been read since the last RS cycle. A HIGH pulse on RT resets the internal read pointer to the first physical location of the FIFO. WCLK and RCLK may be free running but must be disabled during and t_{RTR} after the retransmit pulse. With every valid read cycle after retransmit, previously accessed data is read and the read pointer is incremented until it is equal to the write pointer. Flags are governed by the relative locations of the read and write pointers and are updated during a retransmit cycle. Data written to the FIFO after activation of RT are transmitted also. The full depth of the FIFO can be repeatedly retransmitted.

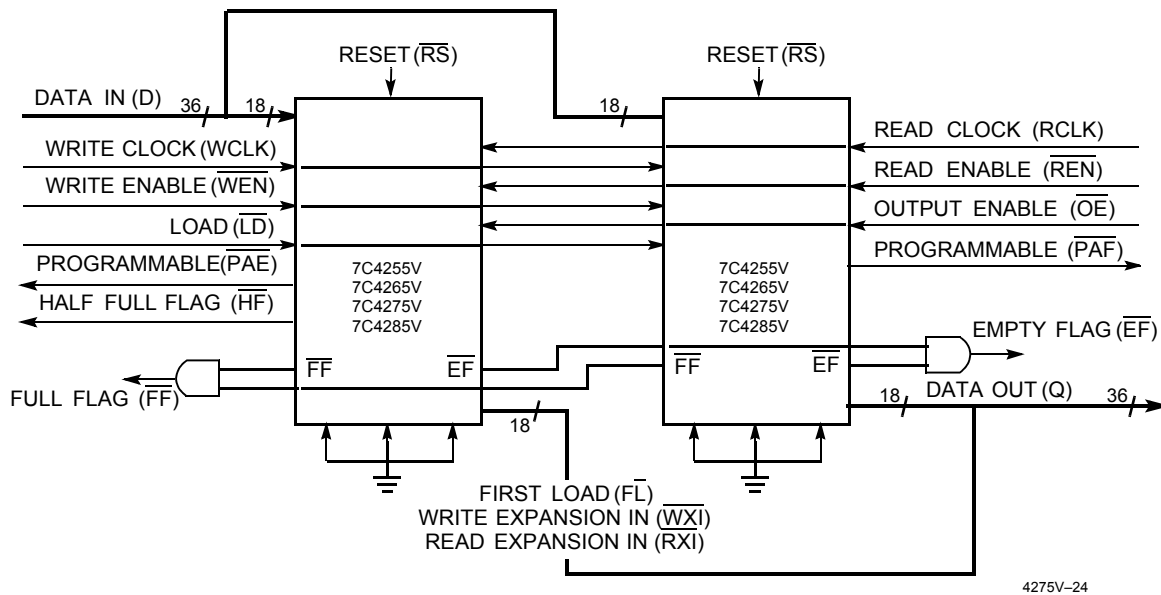

Width Expansion Configuration

The CY7C4255/65/75/85V can be expanded in width to provide word widths greater than 18 in increments of 18. During width expansion mode, all control line inputs are common and all flags are available. Empty (Full) flags must be created by ANDing the Empty (Full) flags of every FIFO. The PAE and PAF flags can be detected from any one device. This technique avoids reading data from, or writing data to the FIFO that is “staggered” by one clock cycle due to the variations in skew between RCLK and WCLK. [Figure 2](#) on page 8 demonstrates a 36-word width by using two CY7C4255/65/75/85Vs.

Notes

- n = Empty Offset (Default Values: CY7C4255/65/75/85V $n = 127$).
- m = Full Offset (Default Values: CY7C4255/65/75/85V $n = 127$).

Figure 2. Block Diagram of 8K/16K/32K/64K x 18 Low Voltage Synchronous FIFO Memory in Width Expansion Configuration

Depth Expansion Configuration (with Programmable Flags)

The CY7C4255/65/75/85V can easily be adapted to applications requiring more than 8K/16K/32K/64K words of buffering. Figure 3 on page 9 shows Depth Expansion using three CY7C4255/65/75/85Vs. Maximum depth is limited only by signal loading. Follow these steps:

1. The first device must be designated by grounding the First Load (\overline{FL}) control input.
2. All other devices must have \overline{FL} in the HIGH state.
3. The Write Expansion Out (\overline{WXO}) pin of each device must be tied to the Write Expansion In (\overline{WXI}) pin of the next device.
4. The Read Expansion Out (\overline{RXO}) pin of each device must be tied to the Read Expansion In (\overline{RXI}) pin of the next device.
5. All Load (\overline{LD}) pins are tied together.
6. The Half Full Flag (\overline{HF}) is not available in the Depth Expansion Configuration.
7. \overline{EF} , \overline{FF} , \overline{PAE} , and \overline{PAF} are created with composite flags by ORing together these respective flags for monitoring. The composite \overline{PAE} and \overline{PAF} flags are not precise.

Figure 3. Block Diagram of 8K/16K/32K/64K x 18 Low Voltage Synchronous FIFO Memory with Programmable Flags in Depth Expansion Configuration

Maximum Ratings

Exceeding maximum ratings^[4] may impair the useful life of the device. These user guidelines are not tested.

Storage Temperature	-65°C to +150°C
Ambient Temperature with Power Applied	-55°C to +125°C
Supply Voltage to Ground Potential.....	-0.5V to V _{CC} +0.5V
DC Voltage Applied to Outputs in High Z State	-0.5V to V _{CC} +0.5V
DC Input Voltage	-0.5V to V _{CC} +0.5V

Output Current into Outputs (LOW).....	20 mA
Static Discharge Voltage.....	>2001V (per MIL-STD-883, Method 3015)
Latch-Up Current.....	>200mA

Operating Range

Range	Ambient Temperature	V _{CC} ^[6]
Commercial	0°C to +70°C	3.3V ±300 mV
Industrial ^[5]	-40°C to +85°C	3.3V ±300 mV

Capacitance

Parameter ^[11]	Description	Test Conditions	Max	Unit
C _{IN}	Input Capacitance	T _A = 25°C, f = 1 MHz,	5	pF
C _{OUT}	Output Capacitance	V _{CC} = 3.3V	7	pF

Notes

- The Voltage on any input or IO pin cannot exceed the power pin during power up.
- T_A is the "instant on" case temperature.
- V_{CC} range for commercial -10 ns is 3.3V ±150mV.
- See the last page of this specification for Group A subgroup [testing information](#).
- The V_{IH} and V_{IL} specifications apply for all inputs except WXI, RXI. The WXI, RXI pin is not a TTL input. It is connected to either \overline{RXO} , \overline{WXO} of the previous device or V_{SS}.
- Input signals switch from 0V to 3V with a rise/fall time of less than 3 ns, clocks and clock enables switch at 20 MHz, while data inputs switch at 10 MHz. Outputs are unloaded.
- All inputs = V_{CC} - 0.2V, except RCLK and WCLK (which are at frequency = 0 MHz), and $\overline{FL/RT}$ which is at V_{SS}. All outputs are unloaded.
- Tested initially and after any design changes that may affect these parameters.

Note

16. t_{PAFasynch}, t_{PAEasynch}, after program register write are valid until 5 ns + t_{PAF(E)}.

Switching Waveforms

Figure 6. Write Cycle Timing

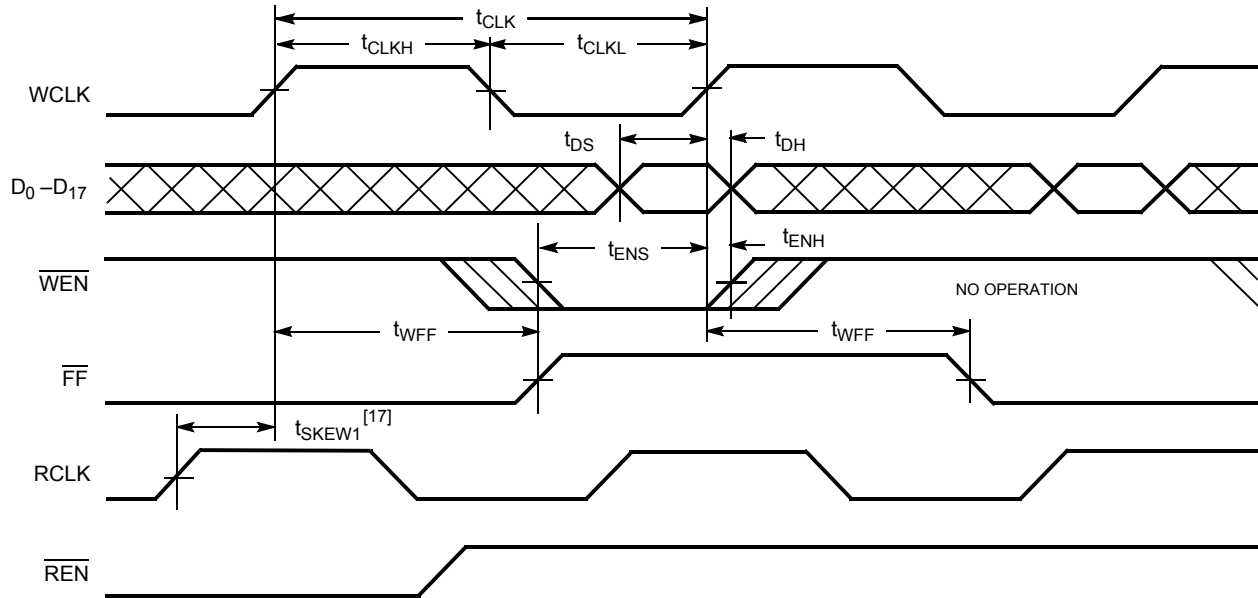

Figure 7. Read Cycle Timing

Notes

17. t_{SKW1} is the minimum time between a rising RCLK edge and a rising WCLK edge to guarantee that FF goes HIGH during the current clock cycle. If the time between the rising edge of RCLK and the rising edge of WCLK is less than t_{SKW1}, then FF may not change state until the next WCLK rising edge.
18. t_{SKW2} is the minimum time between a rising WCLK edge and a rising RCLK edge to guarantee that EF goes HIGH during the current clock cycle. If the time between the rising edge of WCLK and the rising edge of RCLK is less than t_{SKW2}, then EF may not change state until the next RCLK rising edge.

Switching Waveforms (continued)

Figure 8. Reset Timing [19]

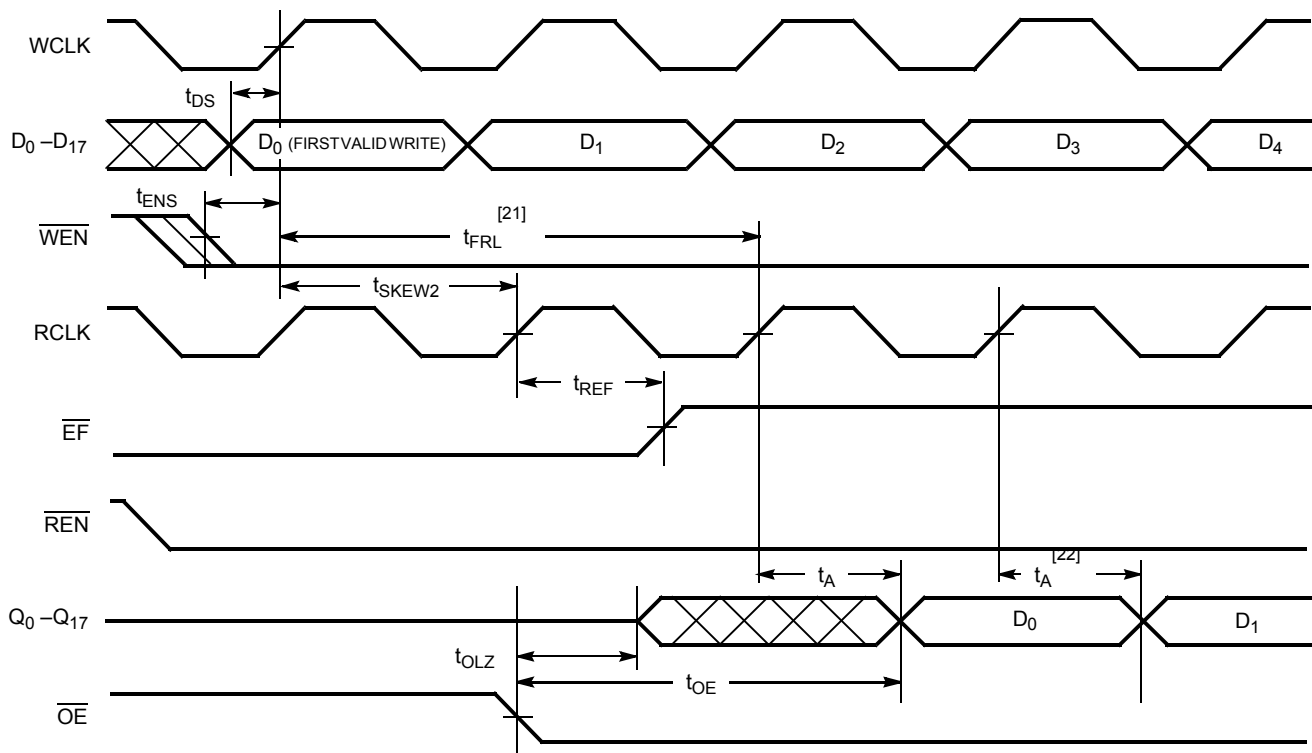

Figure 9. First Data Word Latency after Reset with Simultaneous Read and Write

Notes

19. The clocks (RCLK, WCLK) can be free-running during reset.
20. After reset, the outputs are LOW if $\overline{OE} = 0$ and three-state if $\overline{OE} = 1$.
21. When $t_{SKEW2} \geq$ minimum specification, t_{FRL} (maximum) = $t_{CLK} + t_{SKEW2}$. When $t_{SKEW2} <$ minimum specification, t_{FRL} (maximum) = either $2 * t_{CLK} + t_{SKEW2}$ or $t_{CLK} + t_{SKEW2}$. The Latency Timing applies only at the Empty Boundary (EF = LOW).
22. The first word is always available the cycle after \overline{EF} goes HIGH.

Switching Waveforms (continued)

Figure 10. Empty Flag Timing

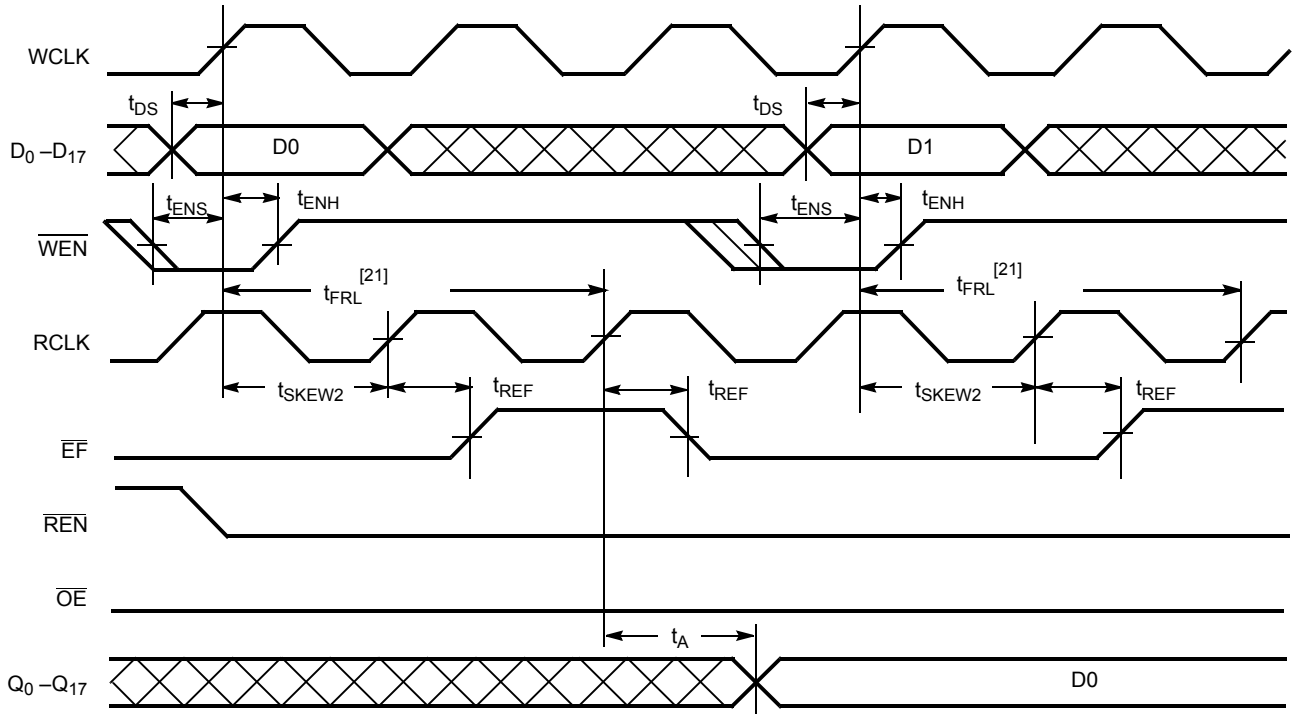

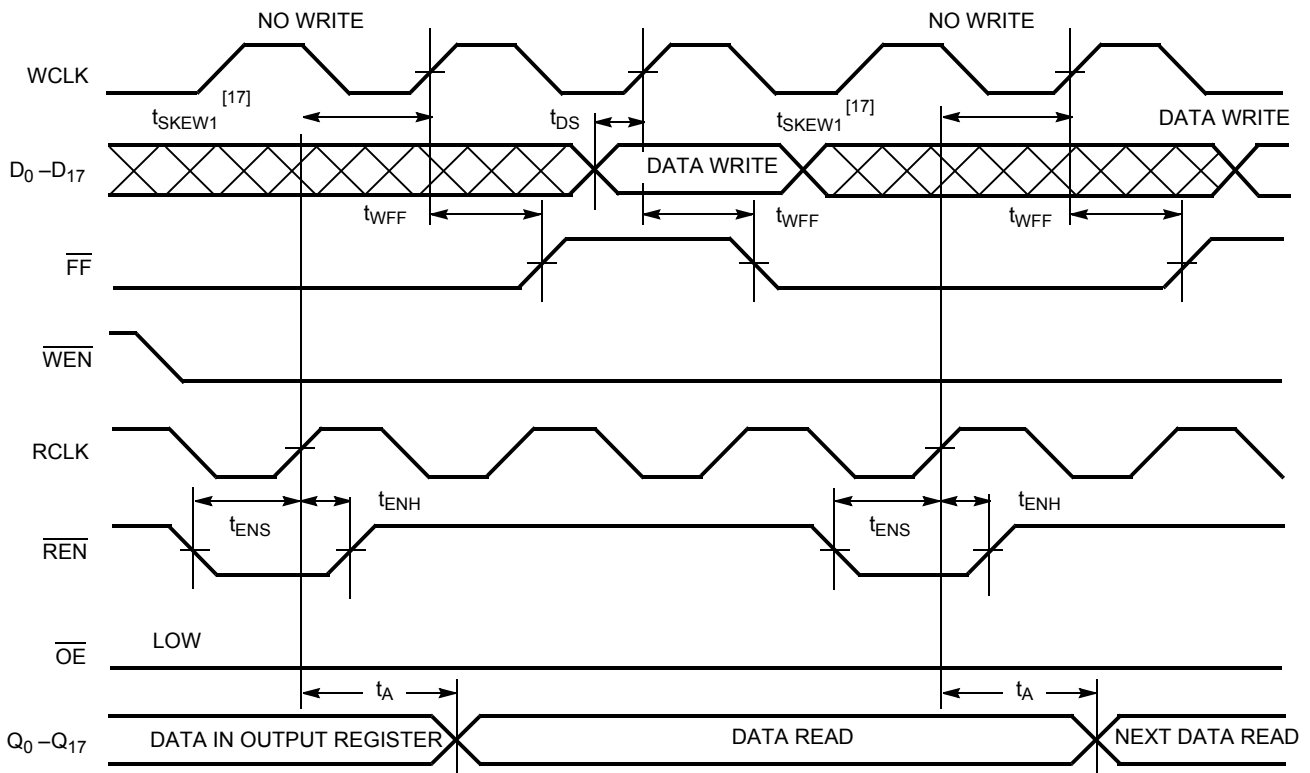

Figure 11. Full Flag Timing

Switching Waveforms (continued)

Figure 12. Half Full Timing

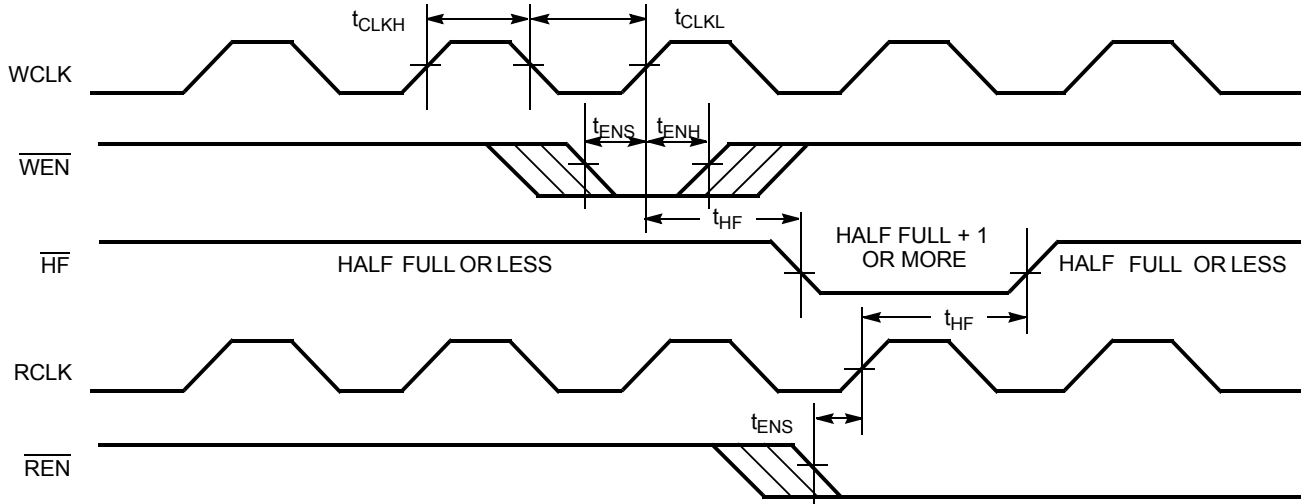

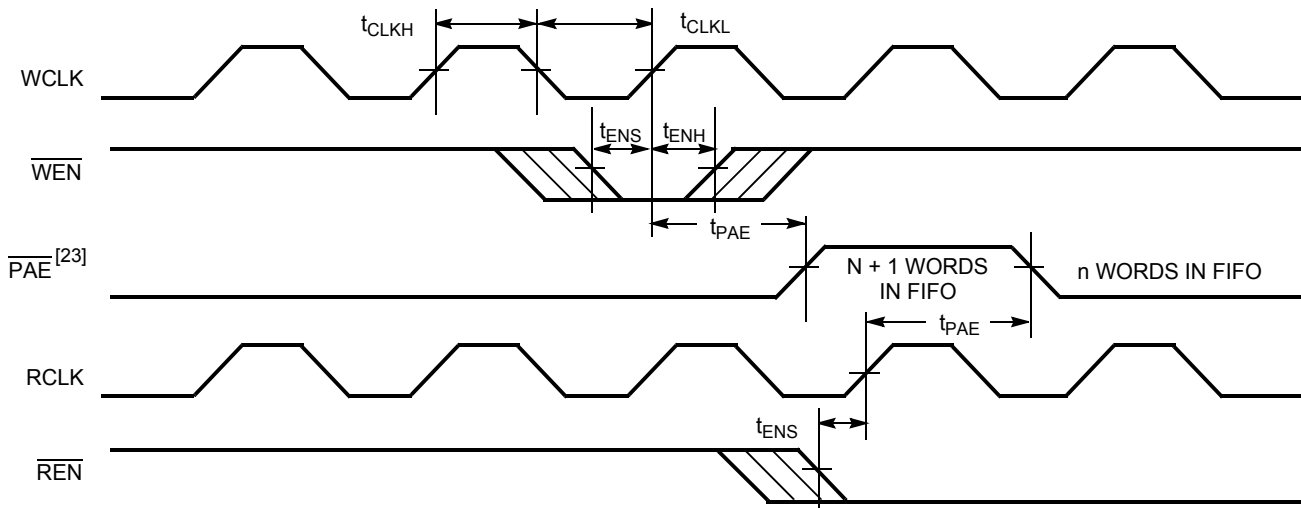

Figure 13. Programmable Almost Empty Flag Timing

Note
23. \overline{PAE} is offset = n. Number of data words into FIFO already = n.

Switching Waveforms (continued)

Figure 14. Programmable Almost Empty Flag Timing (applies only in $\overline{\text{SMODE}}$ ($\overline{\text{SMODE}}$ is LOW))

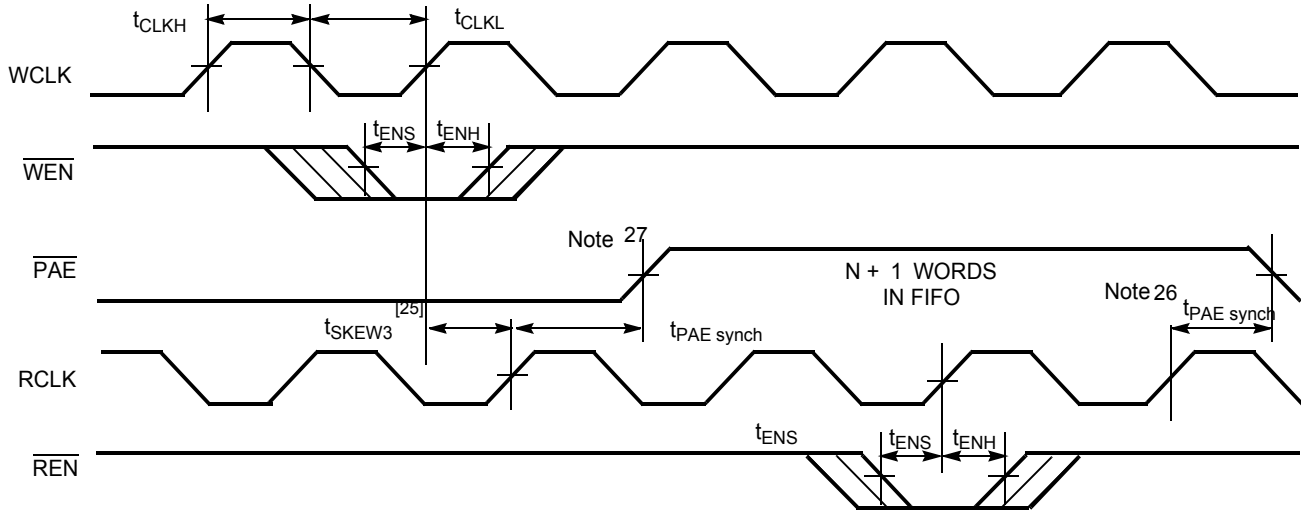

Figure 15. Programmable Almost Full Flag Timing

Notes

24. PAE offset = n.
25. t_{SKEW3} is the minimum time between a rising WCLK and a rising RCLK edge for $\overline{\text{PAE}}$ to change state during that clock cycle. If the time between the edge of WCLK and the rising RCLK is less than t_{SKEW3} , then $\overline{\text{PAE}}$ may not change state until the next RCLK.
26. If a read is performed on this rising edge of the read clock, there are Empty + (n-1) words in the FIFO when $\overline{\text{PAE}}$ goes LOW.
27. PAF offset = m. Number of data words written into FIFO already = 8192 - (m + 1) for the CY7C4255V, 16384 - (m + 1) for the CY7C4265V, 32768 - (m + 1) for the CY7C4275V, and 65536 - (m + 1) for the CY7C4285V.
28. PAF is offset = m.
29. 8192 - m words in CY7C4255V, 16384 - m words in CY7C4265V, 32768 - m words in CY7C4275V, and 65536 - m words in CY7C4285V.
30. 8192 - (m + 1) words in CY7C4255V, 16384 - (m + 1) words in CY7C4265V, 32768 - (m + 1) words in CY7C4275V, and 65536 - (m + 1) words in CY7C4285V.

Switching Waveforms (continued)

Figure 16. Programmable Almost Full Flag Timing (applies only in $\overline{\text{SMODE}}$ ($\overline{\text{SMODE}}$ is LOW))

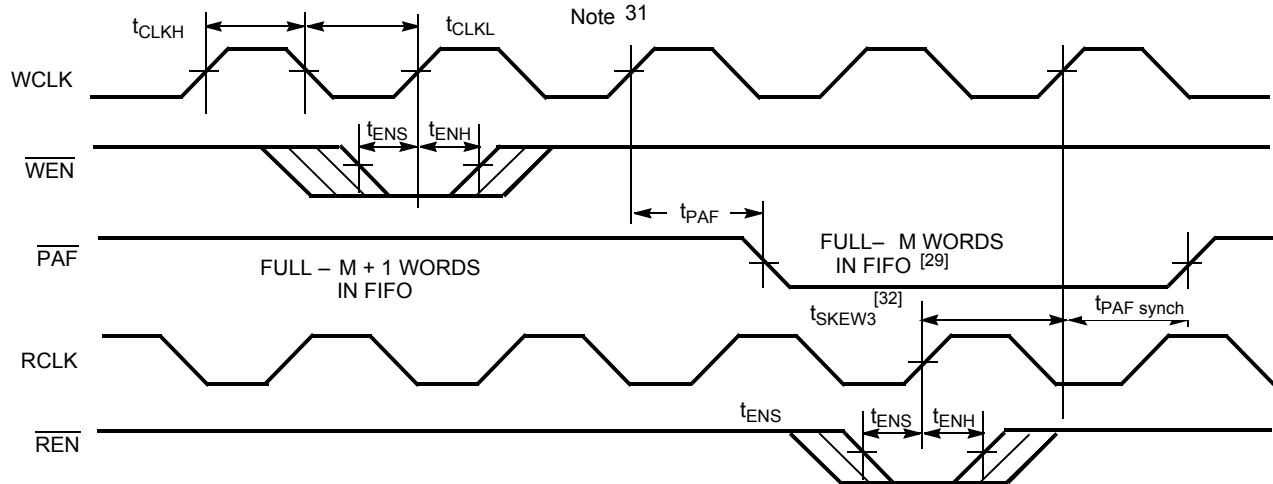

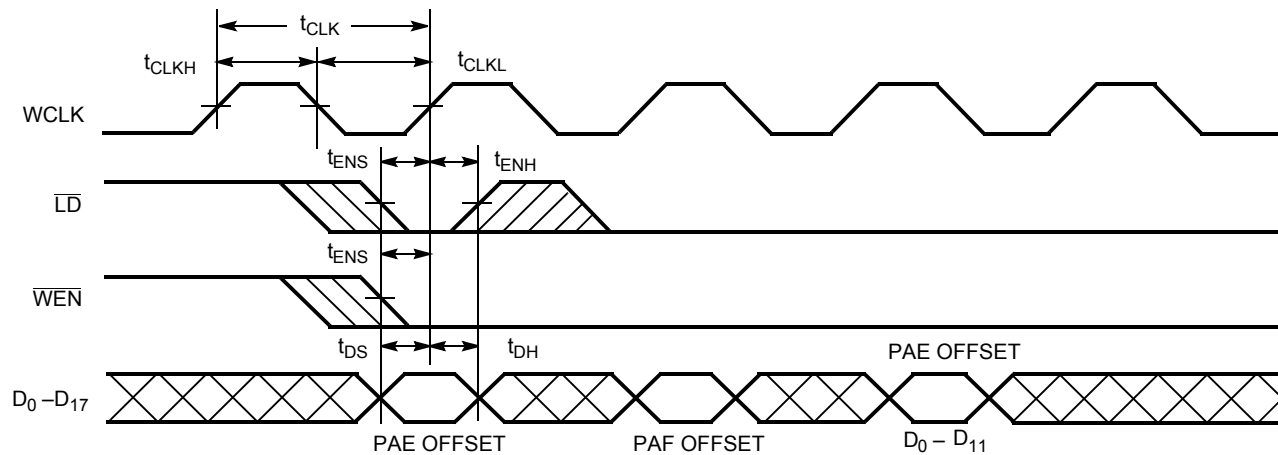

Figure 17. Write Programmable Registers

Notes

31. If a write is performed on this rising edge of the write clock, there are Full - (m-1) words of the FIFO when $\overline{\text{PAF}}$ goes LOW.

32. t_{SKEW3} is the minimum time between a rising RCLK and a rising WCLK edge for PAF to change state during that clock cycle. If the time between the edge of RCLK and the rising edge of WCLK is less than t_{SKEW3} , then $\overline{\text{PAF}}$ may not change state until the next WCLK rising edge.

Switching Waveforms (continued)

Figure 18. Read Programmable Registers

Figure 19. Write Expansion Out Timing

Figure 20. Read Expansion Out Timing

Figure 21. Write Expansion In Timing

Notes
33. Write to Last Physical Location.
34. Read from Last Physical Location.

Switching Waveforms (continued)

Figure 22. Read Expansion In Timing

Figure 23. Retransmit Timing [35, 36, 37]

Notes

35. Clocks are free-running in this case.

36. The flags may change state during Retransmit as a result of the offset of the read and write pointers, but flags are valid at t_{RTR} .

37. For the synchronous PAE and PAF flags (SMODE), an appropriate clock cycle is necessary after t_{RTR} to update these flags.

Ordering Information

8Kx18 Low-Voltage Deep Sync FIFO				
Speed (ns)	Ordering Code	Package Diagram	Package Type	Operating Range
10	CY7C4255V-10ASC	51-85051	64-Pin Thin Quad Flat Pack (10 x 10 x 1.4 mm)	Commercial
