

Dual and Quad, 8MHz, Low Noise Operational Amplifiers

Low noise and high performance are key words describing HA-5102 and HA-5104. These general purpose amplifiers offer an array of dynamic specifications including a 3V/ μ s slew rate and 8MHz bandwidth. Complementing these outstanding parameters is a very low noise specification of 4.3nV/ $\sqrt{\text{Hz}}$ at 1kHz.

Fabricated using the Intersil high frequency DI process, these operational amplifiers also offer excellent input specifications such as a 0.5mV offset voltage and 30nA offset current. Complementing these specifications are 108dB open loop gain and 60dB channel separation. Consuming a very modest amount of power (90mW/package for duals and 150mW/package for quads), HA-5102/04 also provide 15mA of output current.

This impressive combination of features make this series of amplifiers ideally suited for designs ranging from audio amplifiers and active filters to the most demanding signal conditioning and instrumentation circuits.

These operational amplifiers are available in dual or quad form with industry standard pinouts allowing for immediate interchangeability with most other dual and quad operational amplifiers.

HA1-5104-2	-55 to 125	14 Ld CERDIP	F14.3
HA9P5104-9	-40 to 85	16 Ld SOIC	M16.3

Features

- Low Noise 4.3nV/ $\sqrt{\text{Hz}}$
- Bandwidth 8MHz (Compensated)
- Slew Rate 3V/ μ s (Compensated)
- Low Offset Voltage 0.5mV
- Available in Duals or Quads

Applications

- High Q, Active Filters
- Audio Amplifiers
- Instrumentation Amplifiers
- Integrators
- Signal Generators

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

NOTES:

1. Maximum power dissipation, including output load, must be designed to maintain the maximum junction temperature below 175°C for hermetic packages, and below 150°C for plastic packages.
2. θ_{JA} is measured with the component mounted on a low effective thermal conductivity test board in free air. See Tech Brief TB379 for details.
3. Any one amplifier may be shorted to ground indefinitely.

NOTES:

4. Channel separation value is referred to the input of the amplifier. Input test conditions are: f = 10kHz; $V_{IN} = 100mV_{PEAK}$; $R_S = 1k\Omega$.
5. Full power bandwidth is guaranteed by equation: Full power bandwidth = $\frac{Slew\ Rate}{2\pi V_{PEAK}}$.
6. Refer to Test Circuits section of the data sheet.
7. Settling time is measured to 0.1% of final value for a 10V input step, $A_V = -1$.
8. The limits for these parameters are guaranteed based on lab characterization, and reflect lot-to-lot variation.
