

DATA SHEET

Silicon Schottky Barrier Diodes: Packaged, Bondable Chips and Beam Leads

Applications

- Detectors

Features

- Available in both P-type and N-type low barrier silicon
- Low 1/f noise
- Bonded junctions for reliability
- Planar passivated beam-lead and chip construction
- Packages rated MSL1, 260 °C per JEDEC J-STD-020)

NEW

Skyworks offers lead (Pb)-free, RoHS (Restriction of Hazardous Substances) compliant packaging.

Description

Skyworks packaged, beam-lead and chip Schottky barrier detector diodes are designed for applications through 40 GHz in the Ka band. They are made by the deposition of a suitable barrier metal on an epitaxial silicon substrate to form the junction. The process and choice of materials result in low series resistance along with a narrow spread of capacitance values for close impedance control. P-type silicon is used to obtain superior 1/f noise characteristics. N-type silicon is also available.

Packaged diodes are suitable for use in waveguide, coaxial, and stripline applications. Beam-lead and chip diodes can also be mounted in a variety of packages or on special customer substrates.

Unmounted beam-lead diodes are especially well suited for use in Microwave Integrated Circuit (MIC) applications. Mounted beam-lead diodes can be easily used in MIC, stripline, or other such circuitry.

These “universal chips” are designed for a high degree of device reliability in both commercial and industrial uses. The offset bond pad assures that no mechanical damage occurs at the junction during the wire bonding. Additionally, the 4 mil bond pad eliminates performance variation due to bonding, improves efficiency during manual operations, and is ideal for automated assembly.

The choice of N- and P-type silicon allows the designer to optimize the silicon material for the intended application:

- Doppler mixers and high-sensitivity detectors benefit from using the low noise characteristics of the P-type silicon.
- Low conversion loss mixers and biased detectors can be designed using standard N-type material.

Applications

These diodes are categorized by Tangential Signal Sensitivity (TSS) for detector applications in four frequency ranges: S, X, Ku, and Ka bands. However, they can also be used as modulators, high-speed switches, and low-power limiters.

TSS is a parameter that describes a diode’s detector sensitivity. It is defined as the amount of signal power, below a one-milliwatt reference level, required to produce an output pulse with an amplitude sufficient to raise the noise fluctuations by an amount equal to the average noise level. TSS is approximately 4 dB above the minimum detectable signal.

The P-type Schottky diodes in this Data Sheet are optimized for low noise in the 1/f region. They require a small forward bias (to reduce video resistance) if efficient operation is required. The bias not only increases sensitivity but also reduces parameter variation due to temperature change. Video impedance is a direct function of bias and follows the $26/I$ (mA) relationship. This is important to pulse fidelity, since the video impedance together with the detector output capacitance affects the effective amplifier bandwidth.

Bias does, however, increase typical noise, particularly in the 1/f region. Therefore, it should be kept as low as possible (typically 5 to 50 μ A).

Assembly and Handling Procedure

Die Attach Methods

Universal chips are compatible with both eutectic and conductive epoxy die attach methods.

Eutectic composition preforms of Au/Sn or Au/Ge are useful when soldering devices in circuit. Gold/silicon eutectic die attachments can be accomplished by scrubbing the chip directly to the gold plated bonding area.

Epoxy die attachments with silver or gold filled conductive epoxies can also be used when thermal heat sinking is not a requirement.

Wire Bonding

Two methods can be used to connect wire, ribbon, and wire mesh to the chips:

- Thermocompression
- Ballbonding

Skyworks recommends use of pure gold wire (0.7 to 1.25 mil diameter).

Electrical and physical specifications for the silicon Schottky barrier diodes are provided in Tables 1 through 6. SPICE model parameters are defined in Table 7. Typical performance characteristics are shown in Figures 1 through 4. Typical video detector circuits are shown in Figure 5.

Table 1. Electrical Specifications: Beam-Lead P-Type Detector Schottky Diodes

Frequency Band	Part Number	Electrical Characteristics						Test Frequency (GHz)	Outline Drawing
		TSS (dBm) (Note 1)	Rv (Ω)		Cj @ 0 V (pF)	Vf @ 1 mA (mV)	Vb @ 10 mA (V)		
			Typ.	Min.					
X	DDB2503-000	50	500	700	0.15	200-350	2	10.00	491-006

Shipping Information

Individual Chips

Skyworks silicon Schottky barrier diodes are provided in wafer packs. Devices can also be packaged on gel pack carriers.

Wafer Shipment for Whole Wafer

Packaging options include delivery for devices on film frame, in which wafer is sawn on wafer gel pack for uncut, unsawn wafer. Package dimensions are provided in Figures 6 through 15.
